

Community Counts

The HTC Population Profile

The HTC Population Profile is a set of twelve data items collected on patients with bleeding disorders or venous thromboembolism. These patients receive care at Hemophilia Treatment Centers (HTCs) that are part of the US Hemophilia Treatment Center Network (USHTCN), a network of 136 HTCs located throughout the United States and its territories. The HTCs practice a model of care delivery called comprehensive (integrated) care. This care includes specialized prevention, diagnostic, and treatment programs. It also includes family-centered education, research, and support services for patients and families living with bleeding disorders. Congress provides support to the HTCs through the Health Resources and Services Administration and the Centers for Disease Control and Prevention (CDC). CDC sponsors Community Counts, a project with the American Thrombosis & Hemostasis Network and the USHTCN that monitors the complications of bleeding disorders. USHTCN centers that participate in the [Community Counts](#) project collect data on common health issues, medical complications, and causes of death that affect people with bleeding disorders.

Data for the [HTC Population Profile](#) component of the Community Counts project are collected as a de-identified data set, meaning that the person's identity cannot be connected with the information because personal identifiers, such as name, address, and birthdate, have been removed. This is compliant with the [Health Insurance Portability and Accountability Act \(HIPPA\)](#). Authorization from patients for data collection is sought according to the institutional policies of the participating HTCs.

HTCs report on patients 89 years of age or younger who receive care either in person or by telemedicine. The twelve items collected are 1) year of birth, 2) sex, 3) ethnicity, 4) race, 5) [3-digit zip](#) code of residence, 6) insurance status, 7) primary bleeding disorder diagnosis, 8) baseline factor activity , 9) von Willebrand factor activity (vWF:RCof), 10) von Willebrand factor antigen level (vWF:Ag), 11) hepatitis C (HCV) infection status, and 12) human immunodeficiency virus (HIV) infection status. The data are collected on a calendar-year basis. Most data for a given year are reported by February of the following year, but some records may be received later.

The HTCs began collecting data for the HTC Population Profile in 2012. As of December 31, 2016, 136 individual HTCs have contributed data over time. One hundred and twenty-one HTCs have provided data for all five years (2012-2016). The data in these reports are subject to revision.

List of Tables

¹"Unique patients" is the total number of individual patients reported by the HTC's since January 2012. This includes individuals reported in only a single calendar year, as well as those reported in more than one calendar year. Individuals reported in more than one calendar year were counted only once in this column.

²"Multi-year patients" is the total number of individual patients who were reported by the HTC's in more than one calendar year since January 2012. Patients reported in only a single calendar year are not included in this count.

†The HTC Population Profile contains twenty-two transsexual individuals. For confidentiality purposes, the number of transsexual patients is too small to report by year or other characteristics. Transsexual patients have been included in the counts of male and female according to the sex assigned to them at birth since hemophilia and von Willebrand disease, the most common congenital bleeding disorders, affect the sexes differently.

*Except for cells in which the value of the descriptor is "unknown," counts greater than zero but less than five have been suppressed to protect patient confidentiality. Additional cells may be suppressed to prevent derivation of these counts by subtraction.

†HCV and HIV status are not recorded for VTE patients.

**The number of HTC's contributing data for 2013 includes six HTC's that did not contribute data for 2012; two HTC's that contributed data for 2012 did not contribute data for 2013.

***One HTC contributed data only through 9/30/2016. A new HTC began contributing data during the 2016 calendar year.

†The HTC Population Profile contains twenty-two transsexual individuals. For confidentiality purposes, the number of transsexual patients is too small to report by year or other characteristics. Transsexual patients have been included in the counts of male and female according to the sex assigned to them at birth. This is because the most common congenital bleeding disorders, hemophilia and von Willebrand disease, tend to affect the sexes differently.

*Except for cells in which the value of the descriptor is "unknown," counts greater than zero but less than five have been suppressed to protect patient confidentiality. Additional cells may be suppressed to prevent derivation of these counts by subtraction

**Total corrected from reports posted prior to 4/4/2017.
