

Building Our Understanding: Culture Insights

Communicating with Hispanic/Latinos

Culture is a learned system of knowledge, behaviors, attitudes, beliefs, values, and norms that is shared by a group of people (Smith, 1966). In the broadest sense, culture includes how people think, what they do, and how they use things to sustain their lives. Cultural diversity results from the unique nature of each culture. The elements, values, and context of each culture distinguish it from all others (Beebe, Beebe, & Redmond, 2005).

Hispanics in the United States includes any person of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin, regardless of race. Latinos are people of “Latin-American” descent (Webster’s 3rd International Dictionary, 2002). Widespread usage of the term “Hispanic” dates back to the 1970s, when the Census asked individuals to self-identify as Mexican, Puerto Rican, Cuban, Central/South American or “other Hispanic.” While the terms Hispanic and Latino are used interchangeably, they do have different connotations. The Latino National Survey (2006) found that 35% of respondents preferred the term “Hispanic,” whereas 13.4% preferred the term “Latino.” More than 32% of respondents said either term was acceptable, and 18.1% indicated they did not care (Fraga et al., 2006).

Origin can be viewed as the heritage, nationality group, lineage, or country of birth of the person or the person’s parents or ancestors before their arrival in the United States (U. S. Census Bureau, 2000). People who identify their origin as Spanish, Hispanic, or Latino may be of any race (Black/African-American, White/Caucasian, Asian, and Native American) or mixed race. In the 2000 Census, seven million respondents designated themselves as multicultural: 48% of Hispanics identified as “White only,” 2% of Hispanics identified as “Black only,” 42% of Hispanics identified as “Some other race,” and 17% of Hispanics also reported belonging to two or more races.

According to the 2008 U. S. Census Bureau population estimate, there are roughly 46.9 million Hispanics living in the United States (representing 15% of the total U. S. population). Among Hispanic subgroups, Mexicans rank as the largest (66%) followed by Central and South Americans (13%), Puerto Ricans (9.4%), Cubans (3.9%), and people of other Hispanic origins (7.5%). Hispanics/Latinos are a fast-growing, diverse population in the United States. With their growth surging nearly 58% from 1990 to 2000 that is more than four times the growth rate of the U. S. population (U.S. Census, 2008a). These **Culture Insights** help you communicate with them more effectively.

Insights into the Hispanic/Latino Culture

1. By 2011, nearly one person out of every six living in the United States will be of Hispanic/Latino origin (Selig Center Multicultural Economy Report, 2006).
2. The traditional patriarchal structure grants the father or oldest male relative the greatest power, whereas women are expected to show submission (Kemp & Rasbridge, 2004).
3. Hispanics come from a collectivistic culture where group activities are dominant, responsibility is shared, and accountability is collective. Because of the emphasis on collectivity, harmony and cooperation among the group tends to be emphasized more than individual function and responsibility (Gudykunst, 1998).
4. Demographically, Hispanics/Latinos are younger than the non-Hispanic population. The median age of the Hispanic/Latino population in 2006 was 27.5 years compared to that of the U. S. population at 36.9 years. In fact, 62.7% of Hispanics/Latinos are 34 years of age and younger (American Community Survey, 2008).
5. Income levels are rising. While the Hispanic/Latino median income is lower than the U. S. average, data suggest that more Hispanics/Latinos are moving into the middle class (earning at least \$40,000). In addition, Hispanics/Latinos are an increasing proportion of the total affluent market (defined as adults with household incomes of \$100,000 or more). From 1991 to 2000, the growth of affluent Hispanics/Latinos rose 126% (U.S. Census, 2008b).
6. Hispanic/Latino teens are a growing segment. In 2006, Hispanic/Latino teens constituted 20% (estimated 6.3 million) of the U. S. teen population and accounted for more than 38% of the total Hispanic population in the United States (Cheskin Research, 2006).
7. Hispanics live longer. Despite having a lower income than white Americans, Hispanics live longer than whites. Hispanics have an average life-expectancy of 75.1 years for men and 82.6 years for women compared to white Americans of 74.8 years for men and 80.1 years for women (U. S Census Bureau, 2008a).
8. Getting diseases is a bigger concern than dying. For the Hispanic community, issues of morbidity rather than mortality are of greatest concern, which include lifestyle and behaviors affecting health; environmental factors such as exposure to pesticides, unclean air and polluted water; and the ongoing need for more effective use of existing health services (National Alliance for Hispanic Health, 2004).
9. Household size is larger. The average size of Hispanic/Latino households is 3.47 people compared to 2.62 for the total population. In addition, the average family size of Hispanics (3.92 people) is greater than that of the total U. S. population (3.22 people) (American Community Survey, 2008).
10. Children are a big part of family households. In 2008, there were 10.4 million Hispanic family households: 62% included children younger than 18; 66% consisted of a married couple; 43% included a married couple with children younger than 18; and 70% of Hispanic children lived with two married parents (U. S. Census, 2008a).

Culture Insights can help you to communicate more effectively with specific cultures in order to influence their behavior. To develop **Culture Insights**, secondary data is collected and analyzed from CDC-licensed consumer databases, books, articles, and the Internet. **For more information and resources, contact Dr. Stephanie Sargent Weaver with the CDC's Healthy Communities Program at SWeaver@cdc.gov.**

Targeting Health Communication

Knowing the habits and preferences of Hispanics can help you plan effective health communication efforts for this audience.

- Consider custom publications since they have proven to be an important way to communicate with the Hispanic/Latino market. Companies such as Procter & Gamble and Sears have invested millions to reach (and enhance their relationships with) Hispanic/Latino consumers via custom publications in Spanish that address their lifestyle interests and needs (Doublebase Mediamark Research & Intelligence, 2007).
- Hispanic/Latino teens respond best to bilingual ad messages—especially from English-language celebrities “who happen to slip in some Spanish”—because it mirrors their own usage patterns (Cheskin Research, 2006).
- Research shows that while Hispanics consume every type of media, they do seem to have a special attraction to television and radio. These are proven, effective channels in targeting Hispanics (Sonderup, 2010).
- Language is an important aspect that one should be sensitive because it has less to do with competency and more to do with the cultural meanings people attach to language. For Hispanics/Latinos in the U. S., Spanish is a key marker of personal, social and political identity. As a result, Spanish-language TV remains important for even those who are fluent English speakers and who regularly watch English-language TV. In communicating with Hispanics, it is not an either/or question but a matter of carefully integrating both languages to best communicate with the Hispanic/Latino consumer in the U. S. (Tracy, 2004).
- Consider starting with the differentiation of U. S. born and non-U. S. born. By doing that, you will know certain facts about them that will help you reach and communicate with them (Tracy, 2004).
- Understand that it is important to target health messages to men as well as women. Hispanics typically subscribe to values of “machismo” and “marianismo” which culturally define the desirable male and female qualities. True to these values, men are often reluctant to consult physicians for health problems until someone is so ill that they must visit an emergency room. Fathers/husbands may make other family members, especially their wives and daughters, to wait until the last minute for care or take an uncooperative stance on the health care needs of family members. (Parangimalil, 2001).
- Coordinate community outreach activities through established and trusted organizations and people. For example, *promotoras* are trusted community health advisors and can be accessed through Community Health Centers. They visit homes and individually work with families (Maurana & Rodney, 2000).
- Understand that Hispanics/Latinos are assimilating to prevalent U. S. culture, but they are not, and probably never will be, fully assimilated. Instead, theirs is a path of acculturation. It is a process of integration of native and traditional immigrant cultural values with dominant cultural ones (Sonderup, 2010).
- Culture is central in their health habits. These four characteristics have been consistently identified as influencing health habits and should be reflected in communication:
 - (1) A reliance on traditional healing systems is common not only because it is culturally approved but also because of the lower costs involved. Expensive modern medical care is unaffordable for many.

(2) Collectivist values or group orientation permeates Hispanic life and individuals often look to one another for opinions. A collectivist orientation may serve as a valuable asset in terms of health promotion. For instance, dissemination of information about good health habits can be easily achieved in a cost-efficient manner.

(3) An emphasis on the cultural diversity within the Hispanic population when conducting health assessment and promotion. The subgroups of the Hispanic population such as Mexicans, Puerto Ricans, and Cubans differ in their lifestyles, health beliefs, and health practices.

(4) Many recent immigrants are less educated than their U. S. counterparts. They may live a marginal life here, on minimal incomes from low-paying jobs, without health insurance or other fringe benefits. The acculturation struggle has become a source of stress, leading to interpersonal conflicts, family breakdowns, and health problems. Hispanics often accord health-related concerns a secondary relevance only, and traditional health- and illness-related habits and behaviors linger (Parangimalil, 2001).

- Because of their collectivistic values and tendency to look to others to help guide decisions and opinions, consider reaching them through social networks such as Facebook and MySpace which facilitates such collective sharing of information and communication. A recent survey found 44% of English-preferring Hispanics and 35% of Spanish-preferring Hispanics visit MySpace regularly greater than any other ethnic group. Facebook was regularly visited by 18% of English-preferring Hispanics and 13% of Spanish-preferring Hispanics compared to 7% of non-Hispanic Whites (Korzenny & Vann, 2009).
- When deciding where to focus health marketing and communication efforts, consider where most Hispanics live. For example, the three primary country groups demonstrate affinities for different regions, creating their own areas of concentration nationwide. The majority of Mexicans live in the West (55%), 77% of Cubans live in the South and 59% of Puerto Ricans live in the Northeast (U.S. Census Bureau, 2008a).

U.S. Hispanic Population, 2008	
Top 10 States	Population
California	12,146,508
Texas	8,269,407
Florida	3,300,333
New York	2,881,409
Arizona	1,711,429
Illinois	1,533,767
New Jersey	1,221,616

Media Habits

Media Usage		
Averages	Total U. S. population	Hispanic/Latino population
Magazines: # of issues read in a month	11.60	12.70
Newspapers: # read in a 28-day period	19.90	17.20
Radio: # of half-hours listened to in a week	35.80	38.50
Television: # of half-hours viewed in a week	62.60	57.10
Internet: # of times used in a month	77.60	69.30

Source: Doublebase Mediamark Research & Intelligence, 2009.

Magazines

- Overall, Hispanics said that the main reason they read magazines is to keep up to date on the latest styles and trends (61%) (Doublebase Mediamark Research & Intelligence, 2009).

Top 5 Magazines Looked at by Hispanics (Last 6 months)	%
People	43
People en espanol	30
National Geographic	29
Time	25
Sports Illustrated	24

Source: Doublebase Mediamark Research & Intelligence, 2009.

Newspapers

- The top reason that Hispanics reported for reading newspapers is because it keeps them informed and up to date (55%) (Doublebase Mediamark Research & Intelligence, 2009).
- Minority newspapers are an inseparable part of the local minority community. They deliver what no other mass medium can—news that is specifically geared to the needs and concerns of individual minority communities (Sonderup, 2010).
- Newspaper readership skews to adult 34-54 age group with an average household income of \$40K+ (Sonderup, 2010).

Television

- Hispanics reported that the top reason they watch television is because it is pure entertainment (77%) (Doublebase Mediamark Research & Intelligence, 2009).
- 49% of U. S. Hispanics who watch television during prime-time hours, watch Spanish language programming (Sonderup, 2010).

- 40% of Spanish-dominant Hispanics regularly watch English-language programming (Sonderup, 2010).
- 30% of English-dominant Hispanics regularly watch Spanish programming (Sonderup, 2010).

Top TV Shows watched by Hispanics (2-4 times in last month)			
English-Language TV	Nielsen Rating	Spanish-Language TV	Nielsen Rating
American Idol (Fox)	6.5	Manana para Siempre (Univision)	22.1
Dancing with the Stars (ABC)	5.4	Gran Estreno (Univision)	18.3
Grey's Anatomy (ABC)	4.7	Cuidado con el Angel (Univision)	17.5
CSI: Miami (CBS)	3.6	Mujeres Asesinas (Univision)	16.5
House (Fox)	3.6	Aqui y Ahora (Univision)	15.0

Source: Nielsen, 2009.

NOTE: These ratings are based on Hispanic viewership who watched the program while it aired and those who viewed the shows via digital video recorder within 24 hours of their airing. The rating is the percentage of households watching a TV program out of the potential audience of 11.63 million Hispanic households.

Internet

- Overall, the main reason Hispanics reported that they used the Internet because it is a good source of learning (64%) (Doublebase Mediamark Research & Intelligence, 2009).
- The total number of Hispanics using the Internet in January 2010 was 23,625,000, an increase of 3.3 million users from the previous year (comScore Media Metrix, 2010).
- 45% of online Hispanics (10.55 million) now use Facebook (comScore Media Metrix, 2010).
- 36% of English-preferring Hispanics visit social networking sites at least two or three times a month (Korzenny & Vann, 2009).
- When segmenting by age, younger Spanish-preferring Hispanics (35 and younger) are the least likely to use social media (33%) compared to 58% for English-preferring Hispanics and 57% for non-Hispanic Whites. For those older than 36, both English-preferring Hispanics (24%) and Spanish-preferring Hispanics (23%) are the most likely to visit social networking sites more than two or three times a month (Korzenny & Vann, 2009).
- Online Hispanics are young, affluent, have large households, are “more enthusiastic about the benefits of the Internet than the general market,” and are more sophisticated technology users (AOL Advertising & Cheskin Research, 2010).

Top 5 Websites Visited by Hispanics (last 30 days)	%
Google sites	78
Yahoo! sites	78
Microsoft sites	72
Facebook.com	45
Ask Network	38

Source: comScore Media Metrix, 2010.

Radio

- The top reason that Hispanics reported for listening to the radio is because it puts them in a good mood (56%) (Doublebase Mediamark Research & Intelligence, 2009).
- The most unique aspect of Spanish-language radio stations is the time spent listening. The Hispanic population often listens to the radio all day. The entire family may listen to one station and tune in, on average, 26-30 hours per week. This ranks more than 13% above the general population (Sonderup, 2010).

Priority Health Concerns

Hispanics have lower mortality rates than the overall population but are at greater risk for a number of chronic illnesses and diseases. Hispanic populations exhibit a number of positive health indicators in terms of diet; low levels of smoking and illicit drug use; and a strong family structure. However, the longer each generation has been in this country these positive indicators tend to deteriorate (National Alliance for Hispanic Health, 2004).

Hispanics share a range of sociocultural characteristics, as well as national, experiential, and in some instances genetic make-up, that can impact their health status within the United States. For example, certain cultural factors such as a more traditional diet and lower rates of smoking among women impact favorably on their health status. Other factors like low-immunization rates linked to low-economic status and fear of authority among new immigrants have negative consequences. Acculturation among new immigrants and their children seems to weaken the

positive health factors and lead to the adoption of negative ones from U. S. culture (such as smoking, alcohol use, and early sexual activity).

The top ten leading causes of death for Hispanics of all age groups are:

1. Heart disease
2. Malignant neoplasms
3. Accidents and adverse effects
4. Human immunodeficiency virus infection (HIV),
5. Homicide and legal intervention
6. Cerebrovascular diseases
7. Diabetes mellitus
8. Chronic liver disease and cirrhosis
9. Pneumonia and influenza
10. Certain conditions originating in the prenatal period. (National Alliance for Hispanic Health, 2004).

The top two leading causes of death are the same for the Hispanic and the non-Hispanic white population: heart disease and cancer (National Alliance for Hispanic Health, 2004). The 2009 edition of *Cancer Facts & Figures for Hispanics/Latinos* reports that Hispanic/Latino Americans have a unique cancer profile that requires a targeted approach to cancer prevention. Hispanic/Latino Americans are less likely than non-Hispanic whites to develop and die from all cancers combined as well as the four most common cancers (female breast, prostate, colorectum, and lung). However, Hispanics have higher rates of several cancers related to infections (stomach, liver, and cervix) and are more likely to have cancer detected at a later stage (American Cancer Society, 2009).

The proportion of recent Mexican immigrant adults who characterize their health as fair to poor is lower than that of long-term Mexican immigrants, U. S. born Mexican Americans and U. S. born non-Latino whites. Even after age differences are factored, Mexican immigrants report fewer chronic conditions overall, spend fewer days in bed because of illness, and have lower mortality rates than U. S. born non-Latino whites (Dey & Lucas, 2006; Turra & Goldman, 2007).

Health Care-Seeking Behaviors

- Many Hispanics combine traditional health care practices with Western medicine. Although the use of Western medicine tends to be more prevalent, Hispanics who cannot afford these services often resort to traditional practices (Livingston, 2009).
- Traditional practices include using home remedies (e.g., drinking herbal or spiced teas) and seeking care from relatives, neighbors, community members, or traditional health care providers.
- Although the matriarch often determines when a family member needs medical care, the male head still gives permission to seek treatment (Smith, 2000).
- Some medications sold only by prescription in the United States, including antibiotics, may be purchased easily without a prescription from Mexican *farmacias* (pharmacies). Regardless of their insurance status, Mexicans living in the United States may make regular trips to Mexico to purchase medications at a lower cost (Becker, Garcia, & Ellertson, 2004; Calvillo & Lal, 2003; Flores, Ochoa, Briggs, Garcia, & Kroeger, 2003).

- Hispanics have the highest uninsured rates (32%) of any racial or ethnic group within the United States. They are twice as likely as the overall U. S. population (15%) to lack health insurance coverage. Among foreign-born Hispanics, the uninsured rate climbs to 50%. Those without health insurance varied among Hispanic subgroups: 49.3% of Hondurans, 47.9% of Guatemalans, 38.9% of Salvadorans, 34.8% of Mexicans, 34.7% of Ecuadorians, 30.2% of Peruvians, 26.4% of Colombians, 23.4% of Dominicans, 22.7% of Cubans, and 15.6% of Puerto Ricans. (Pew Hispanic Center, 2010).
- Research suggests a lack of health insurance results in fewer visits to primary care physicians (Hough et al., 1987; Trevino, Moyer, Valdez, & Stroup-Benham, 1991) and more emergency room visits (Smith, 2000).
- Occupations that rely heavily on Mexican immigrant labor pay low wages and seldom offer health insurance posing health risks for workers and their families (CONAPO & University of California, 2005)

Traditional Health Beliefs and Practices

The meaning of health varies among Hispanics. Some maintain that health results from good luck or is a reward for good behavior (Spector, 1996). Illnesses are thought to have either natural or supernatural causes. Some common folk illnesses, causes, and remedies include:

Humoral Imbalance

- In general, physical and mental illness is thought to result from an imbalance between a person and the environment, expressed as either “hot” and “cold” or “wet” and “dry” (Kemp & Rasbridge, 2004; Spector, 1996). The four humors contained in the body include blood (hot and wet), yellow bile (hot and dry), phlegm (cold and wet), and black bile (cold and dry) (Spector, 1996). To correct an imbalance, people consume foods or herbs with the opposite quality (e.g., “cold” conditions are treated with “hot” medications) (Smith, 2000).

Empacho

- Illness can also result from a “dislocation” of different parts of the body. Empacho, an example of dislocation, is a form of upset stomach or indigestion, thought to be caused by eating the wrong food at the wrong time of day, eating undercooked food, or swallowing gum. The most common treatment is rubbing the stomach or back gently with cooking oil and pinching the spine (Smith, 2000; Spector, 1996).

Mal de Ojo

- “Bad eye” is caused when someone looks with admiration or jealousy at another person. The person looked upon experiences malaise, sleepiness, fatigue, and severe headache. Folk remedies include saying a prayer while passing an egg over the victim’s body then placing the egg in a bowl under the victim’s bed overnight, or alternately, having the person who caused the *mal de ojo* care for the victim (Kemp & Rasbridge, 2004).

Envidia

- Many Mexicans believe *envidia*, or envy, causes illness and bad luck. Envy can be provoked by success, but can result in misfortune and illness. Some research concludes that low economic status is associated with the belief in *envidia* (Spector, 1996).

Susto

- Also known as fright sickness, *susto* arises from a traumatic or frightening experience and is thought to cause soul loss, whereby the soul leaves the body and wanders freely (Kemp & Rasbridge, 2004). Symptoms include anxiety, depression, insomnia, introversion, irritability,

lethargy, and anorexia. Tuberculosis is sometimes classified as *susto* (Kemp & Rasbridge, 2004; Spector, 1996).

Cultural Elements

Cultural elements are categories of things and ideas that identify the most profound aspects of cultural influence (Smith, 1966). Several researchers have identified 5 cultural elements:

Material culture: things and ideas

Social institutions: schools, governments, religious organizations

Belief systems: ideas about individuals and the universe

Aesthetics: music, theater, art, dance

Language: verbal and nonverbal communication system (Cateora & Hess, 1979; Hofstede, 1980; 1984; Samovar & Porter, 2001).

As we grow, we learn to value these cultural elements. You were not born knowing what you liked in music, clothes, and automobiles. Through **enculturation**, the process of communicating a group's culture from generation to generation, you learned what you liked by choosing from among the elements available within your culture (Smith, 1966). Your friends, colleagues, the media, and most importantly, your family, communicate information about these elements and advocate choices for you to make.

Cultures are not static; they change as new information and new influences penetrate their stores of knowledge. Some changes come about as a result of scientific discoveries (i.e., we no longer believe that bathing is unhealthy, or that we can safely use makeup containing lead). But other changes take place through **acculturation** where we acquire other approaches, beliefs, and values by coming into contact with other cultures (Smith, 1966).

Material Culture

- 83.4% of Hispanics/Latinos are private wage and salary workers compared to 79.0% of the general population (American Community Survey, 2008).
- Of Hispanics in the civilian labor force, 79,400 are chief executives; 50,866 physicians and surgeons; 48,720 postsecondary teachers; 38,532 lawyers; and 2,726 news analysts, reporters, and correspondents (U. S. Census Bureau, 2008b).

Occupations					
Civilian employed population 16 years and older	Mexican population (13,119,496), %	Puerto Rican population (1,683,817), %	Cuban population (755, 475), %	Total Hispanic/Latino population (20,663,445), %	Total U.S. population (146,266,253), %

Source: U.S. Census Bureau, 2008 American Community Survey.

- In 2002, there were 1.6 million Hispanic-owned businesses in the United States. Nearly 43% of Hispanic-owned firms operated in construction; administrative and support; waste management and remediation services; and other services, such as personal services, and repair and maintenance (U. S. Census Bureau, 2008b).
- 44.6% of all Hispanic-owned firms were owned by Mexicans, Mexican-Americans, and Chicanos (i.e., U. S. citizens of Mexican descent) (U. S. Census Bureau, 2008b).

Social Institutions

- The religious affiliation of Hispanics/Latinos in the U. S. is 68% Catholic, 20% Protestant, 8% Secular, 3% Other Christians, and 1% Other Faiths (Pew Forum on Religion & Public Life, 2007).
- Renewalist Christianity, which places special emphasis on God's ongoing, day-to-day intervention in human affairs through the person of the Holy Spirit, appears to be much more prevalent among Hispanics than among their non-Latino counterparts (Pew Forum on Religion & Public Life, 2007).
- Two-thirds of Hispanic/Latino worshippers attend churches with Latino clergy, where services are offered in Spanish, and where most other worshippers are Hispanic/Latino (Pew Forum on Religion & Public Life and Pew Hispanic Center, 2007).

Educational Attainment					
Population 25 years and older	Mexican population (15,816,915), %	Puerto Rican population (2,375,539), %	Cuban population (1,139,940), %	Total Hispanic/Latino population (25,557,507), %	Total U. S. population (200,030,018), %
Less than HS diploma	45.2	27.1	24.4	39.2	15.0

Graduate or professional degree	2.5	5.1	9.5	4.0	10.2

Source: U.S. Census Bureau, 2008 American Community Survey.

Belief Systems

- The majority of Hispanics believe that God is an active force in everyday life. Most Latinos pray every day, most have a religious object in their home and most attend a religious service at least once a month (Pew Forum on Religion & Public Life and Pew Hispanic Center, 2007).
- Faith and church are often central to family and community life; this is especially apparent in the understanding of illnesses and healing (Kemp & Rasbridge, 2004).
- *Familismo* is the value of family over individual or community needs and the expression of strong loyalty, reciprocity, and solidarity among family members (Smith, 2000).

Aesthetics

- The Chicano movement of the 1960's and 70's brought about a new assertiveness in how Mexican Americans saw themselves in a new America. This political and cultural movement, identified as La Raza sprouted a related art scene, made publicly famous by its bold and colorful wall murals. There are several groups or coalitions designed specifically to promote the work of Hispanic artists.
- Hispanics/Latinos have many holiday celebrations that are not generally celebrated by others in the United States such as La Semana Santa (Easter Holy Week), Three King's Day or El Dia De Los Tres Magos on January 6th, Día De los Muertos or Day of the Dead on November 1st and 2nd, The Feast of Our Lady of Guadalupe on December 12th, and "Las Posadas" (the nine days prior to Christmas Day) (Winchester, 2000).
- Food plays an important role in the Hispanic culture. In some Hispanic cultures, a good meal will be balanced in food and herbs by "hot" and "cold" types. Those who eat foods whose temperatures are wrong for them can get sick. A good appetite is associated with good health. Children are not forced to eat foods that they resist because their preferences are respected. A

mother or grandmother will withhold a food she thinks causes illness from her children's diet. A list of harmful foods is passed along from generation to generation, with other food beliefs, from mother to daughter (Sanjur, 1994).

Language

- Most immigrants speak English on a regular basis and the younger ones also make it their preferred language of use. Some of the younger Hispanics/Latinos abandon the use of Spanish altogether (Rodriquez-Reimann et al., 2004).
- Verbal communication is courteous and respectful using the Spanish *usted* form (i.e., the formal, polite “you”) to address others (Guarnero, 2005).
- In nonverbal communication maintaining eye contact can be interpreted by Mexicans as a challenge or intimidation (Guarnero, 2005).
- Hispanic social norms emphasize the importance of communication (verbal and nonverbal) in interpersonal relationships (Salimbene, 2000; Smith, 2000).

Language spoken at home and ability to speak English					
Population 5 years and over	Mexican population (26,990,822), %	Puerto Rican population (3,788,020), %	Cuban population (1,513,610), %	Total Hispanic/Latino population (41,638,535), %	Total U. S. population (283,149,507), %
English only	23.8	33.6	16.6	23.7	80.3
Language other than English	76.2	66.4	83.4	76.3	19.7
Speak English less than “very well”	38.4	19.7	41.7	37.3	8.6
