Many American communities lack environments that could support healthy diets and regular physical activity. Healthy dietary and physical activity practices can lower the risk for heart disease, type 2 diabetes, and some cancers.1,2

In addition, excess calorie intake and physical inactivity contribute to obesity, which is associated with some of the leading preventable chronic diseases, including heart disease, stroke, type 2 diabetes, and some cancers. Among adults, the medical costs associated with obesity are an estimated $147 billion.1,2,3

Public health approaches can help make healthy options available, accessible, and affordable. The Centers for Disease Control and Prevention’s Division of Nutrition, Physical Activity, and Obesity (DNPAO) supports the nation to establish sustainable programs to improve dietary quality, increase physical activity, and reduce obesity and overweight. DNPAO funds and works with state health departments through a cooperative agreement (State Public Health Actions to Prevent and Control Diabetes, Heart Disease, Obesity and Associated Risk Factors and Promote School Health program).

This profile highlights data on dietary quality, physical activity, and obesity in Hawaii and select activities funded with this cooperative agreement. For more information about CDC’s work to support healthy eating and physical activity, please see the DNPAO website.

### Population Statistics

**Estimated Population of Hawaii:** 1,413,603

### Adult Statistics

**Dietary Behaviors**

- 39.2% of adults reported consuming fruit less than one time daily.
- 23.1% of adults reported consuming vegetables less than one time daily.

**Physical Activity**

- 60.2% of adults achieved the equivalent of at least 150 minutes of moderate intensity physical activity per week.

**Overweight and Obesity**

- 36.0% of adults were overweight.
- 22.1% of adults had obesity.

### Adolescent Statistics

**Dietary Behaviors**

- 45.2% of adolescents reported consuming fruit less than one time daily.

### Child Statistics

**Breastfeeding**

- 85.0% of infants were ever breastfed.
- 64.5% of infants were breastfed for at least 6 months.

**Overweight and Obesity**

- 12.8% of children aged 2 to 4 years in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) program were overweight.
- 10.2% of children aged 2 to 4 years in WIC had obesity.
State Activities

Hawaii worked on the following select activities during the first 2 years of the State Public Health Actions program.

- Adopted a nutrition wellness policy for meetings and events that implement standards for foods and beverages. The new policy requires that healthy options be provided when foods or beverages are served and includes meal planning guidance and physical activity tips for meetings.
- Worked with the Department of Human Services business enterprise program to pilot healthy vending and marketing strategies for state concessions and vending operations. Hawaii identified six interested vendors, collected baseline data, developed healthy snack and beverage criteria, and evaluated impact.
- Worked with distributors to identify foods that meet established nutrition standards to assist snack shop vendors in easily identifying them when shopping or ordering.
- Partnered with Healthways to help Hawaii state government agencies develop worksite wellness policies and procedures that increase opportunities for physical activity.
