

# Ambulatory and Hospital Care Statistics Branch Overview

## NCHS Board of Scientific Counselors

Paul Beatty

April 15, 2011

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES  
Centers for Disease Control and Prevention  
National Center for Health Statistics

# Topics

- Mission
- Surveys
- Data products
- Dissemination and uses of our data
- Key challenges and opportunities

# **Role of AHCSB within the Division**

- **The Division's Mission**

To collect, analyze, and disseminate data on the use, access, quality, and cost of health care provided in the United States, and the health care organizations who deliver that care.

- **The Branch's Role**

To collect, analyze, and disseminate those data that specifically relate to ambulatory and hospital care providers, their services, and the people they serve.

# National Health Care Surveys

- **Ambulatory and hospital care surveys**
  - National Ambulatory Medical Care Survey (NAMCS)
  - National Hospital Ambulatory Medical Care Survey (NHAMCS)
  - National Hospital Discharge Survey (NHDS)
- Long-term care surveys
  - National Nursing Home Survey (NNHS)
  - National Home and Hospice Care Survey (NHHCS)
  - National Survey of Residential Care Facilities (NSRCF)
  - National Survey of Long-Term Care Providers (NSLTCP)

# National Health Care Surveys

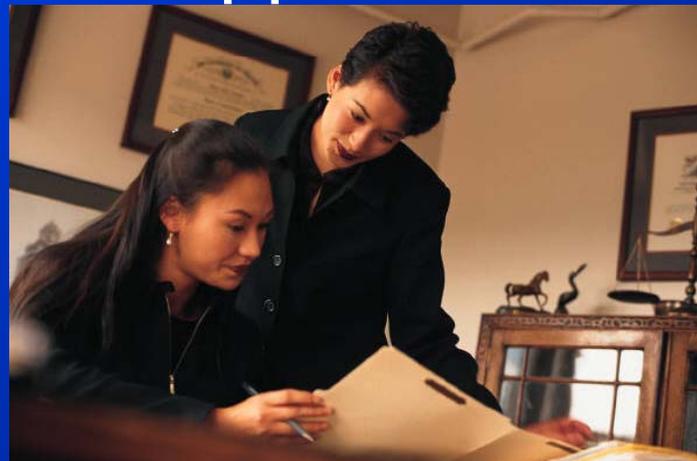

- **Ambulatory and hospital care surveys**
  - **National Ambulatory Medical Care Survey (NAMCS)**
    - Expanded sample and new content
  - **National Hospital Ambulatory Medical Care Survey (NHAMCS)**
  - **National Hospital Discharge Survey (NHDS)**
  - **National Hospital Care Survey (NHCS)**
    - Consolidates data elements from NHDS and NHAMCS with new features
  - **Electronic Health Record and Physician Workflow Supplements**
  - **National Survey of Prison Healthcare**

# Distinctive Aspects of the Surveys

- Surveys of establishments (not households)
- Encounter-level data
- Some data collected through interview, particularly facility-level
- Patient-level data from medical and administrative records, traditionally through abstraction

# National Ambulatory Medical Care Survey (NAMCS)

- Visits to non-federal, office-based physicians primarily engaged in patient care
- Data at practice, clinician, and patient level
- Flexible content: questions added and deleted, with supplemental modules

# NAMCS Changes for 2012

- Affordable Care Act (ACA) funding will allow for major increases in sample— from current 3,000 physicians to (at least )12,000
- Permits monitoring and evaluation of the effects of health reform
- Supports state activities to monitor the effects of Medicaid expansions in reducing morbidity and mortality from chronic disease and other preventable conditions

# Lookback Module on Prevention of Heart Disease and Stroke

- To monitor and evaluate services to prevent major causes of death and disability, namely heart disease and stroke
- To expand the current data collection to include risk factors and appropriate preventive services 12 months prior to the sampled office visit
- To include patients at higher risk, e.g., with hypertension or prior stroke

# Improving data collection capabilities

- Paper-and-pencil data collection methods have been outdated for many years
- The intense volume of forms and requirements of the lookback module made it critical to develop improvements
- Computerizing data collection was a key component of ACA funding
- Great improvements to the timeliness of data release and efficiency of production

# National Hospital Ambulatory Medical Care Survey (NHAMCS)

- NHAMCS' objectives are similar to NAMCS, but with a focus on care in different settings:
  - Outpatient Departments
  - Emergency Departments
  - Hospital-based Ambulatory Surgery Centers (since 2009)
  - Free-standing Ambulatory Surgery Centers (since 2010)
  - The latter two were originally collected on the National Survey of Ambulatory Surgery (NSAS) last conducted as a stand-alone in 2006.

# National Hospital Discharge Survey

- Inpatient visits to non-federal short-stay hospitals
- Conducted since 1965– longest continuous survey in the Branch
- Concluding with the 2010 data collection year , but much content going into new survey

# National Hospital Care Survey: Objectives

- Continue to provide national general purpose hospital statistics, on inpatient and ambulatory encounters
- Move toward electronic collection of data
- Permit special studies, as needed
- Link encounters across hospital units, both inpatient and ambulatory, and with other data sources, e.g., the National Death Index and Medicare

# Comparison of Inpatient Content

## NHDS

- Selected UB04 elements
  - Patient age, gender, race/ethnicity, expected source of payment, marital status
  - Source and type of admission
  - Length of stay
  - Diagnoses and procedures
  - Discharge status
- No protected health information (PHI)
- Limited facility data

## NHCS

- All UB04 elements
- PHI: *name, address, SSN, Medicare #*
- PHI allows linkage for pre and post hospital care
- PHI allows linkage to NDI and CMS data
- Special topics
- Expanded facility level data

# NHCS Goes Electronic

- Currently piloting the transmission of electronic claims data – UB-04s—for inpatient discharges
- Hospitals transmit data through a secure data network
- As hospitals adopt electronic health records, we will be conducting more pilots on extracting clinical data from EHRs

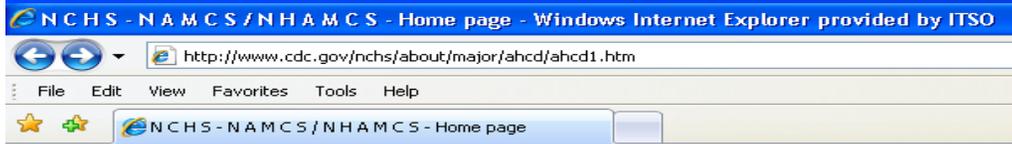

## Timeframe and Milestones

- Summer 2011-Fall 2012  
Recruit new sample of 500 hospitals
- 2011 and continuing  
Collect inpatient data electronically  
Provide platform for sponsored special studies
- 2013  
Add ambulatory component (NHAMCS):  
emergency and outpatient departments, ambulatory  
surgery centers (hospital and additional freestanding)  
Transition to extracting data from EHRs, as possible

# New and expanded surveys

- **Electronic Health Records Supplement**
  - Supplement to NAMCS in 2008-09, expanded 5-fold to stand-alone capable of state-based estimates
- **Physician Workflow Supplement**
  - Three-year longitudinal effort following EHR respondents to learn more about costs, benefits, and barriers of adopting systems
- **National Survey of Prison Healthcare**
  - Fill gaps in our knowledge about healthcare provided to inmates in correctional system, extending our efforts to institutional population

# Data Release

## Public-Use Data Files (micro-data) (1973-2006)

### Downloadable data files:

**Notice:** Currently, NAMCS and NHAMCS public-use files for 1993-2006 contain sample design variables in masked form. The initial release of the 2000-2006 public-use files included masked sample design variables. We re-released the 1993-99 NAMCS and NHAMCS files to include these variables. For re-released files, file names and layouts are essentially the same, but the design variables were appended to each file according to a generic file layout that is available for downloading below. Public-use files for previous years of data will be re-released with masked sample design variables on an ongoing basis.

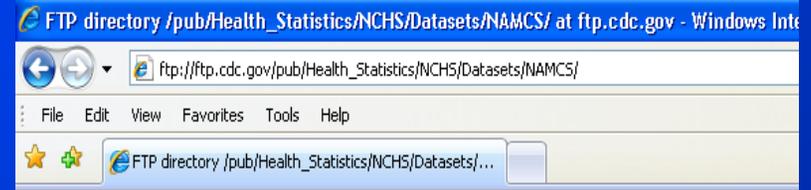

However, data users should note that, beginning with the 2002 public use files, two new masked design variables were added to the file, for use with statistical software that assumes a single stage of sampling. For the 2003 public use files and beyond decision was made to include only these two masked design variables for variance estimation. Therefore, data users will need to combine years of data from 2003 and beyond with year to 2002. A technical paper, *Using Ultimate Cluster Models NAMCS and NHAMCS Public Use Files*, gives instructions. [PDF](#)

- [NAMCS, 1993-2006](#)
- [NAMCS, 1973-1992](#)
- [NHAMCS, 1992-2006](#)
- [Public Use Data File Updates](#)

### Downloadable documentation:

**Notice:** For data years 1993-99, be sure to download not only the original file documentation for each year, but also the supplemental files that explain the new sample design variables that have been added to each file. The supplemental files include descriptions of any revisions that may have been made to the original data files.

## EXAMPLE 1

In this example, data from the 2005 ED public use file are being used to determine caseload percentages across emergency departments from expected sources of payment. (See Figure 7 in Advance Data Report No. 376 for a graphic display of similar results using 2003-04 data.)

This example assumes you have downloaded the 2005 ED public use file and uncompressed it, downloaded the SAS input statement from the Ambulatory Health Care Data website, and have placed them both on your desktop in the folder 'c:\myfiles\nhamcs'.

**Decreasing Hospital Use For HIV**

Data from the [National Hospital Discharge Survey](#) show declines in hospital use for patients with human immunodeficiency virus (HIV) from 1995 to 1997. These trends in inpatient care are consistent with declines reported in mortality and morbidity for HIV. The age-adjusted death rate per 100,000 population for HIV dropped from 15.6 in 1995 to 5.9 in 1997. This unprecedented decline has been attributed to use of intensive antiretroviral therapies. These drugs also appear to have had a major impact on the need for hospital care for the HIV.

HIV patients had 71,000 fewer hospitalizations in 1997 than in 1995. Their average length of stay in the hospital was 1.2 days shorter in 1997. This resulted in 878,000 fewer days of hospital care for HIV patients. Both the number and rate of hospitalizations fell by approximately 30% during this period, and the number and rate of days of care declined by almost 40%. More than 70% of the hospitalizations for HIV in both 1995 and

## Visits to Primary Care Delivery Sites: United States, 2008

Esther Hing, M.P.H., and Sayeedha Uddin, M.D., M.P.H.

### Key findings

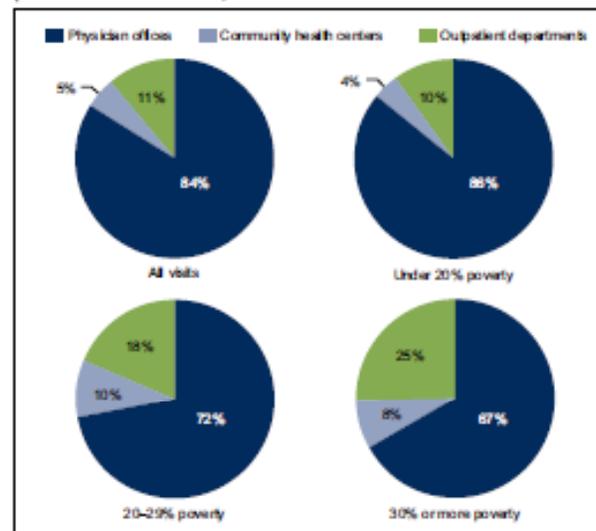

- In 2008, the majority of visits to primary care delivery sites (84%) occurred in physician offices, 11% in hospital outpatient departments (OPDs), and 5% in community health centers (CHCs).
- Patients with Medicaid, State Children's Health Insurance Plan (SCHIP) or no insurance accounted for a higher percentage of visits to CHCs (20%) and OPDs (40%) than to physician offices (17%).
- CHCs had a higher age-adjusted percentage of visits by patients with one or more chronic conditions (56%) compared with visits to physician offices (49%) and OPDs (49%).

Interest in access, utilization, and quality of primary care has increased due to its potential to prevent more serious health-related events (1-4). This report compares care delivered in physician offices, hospital outpatient departments (OPDs) and community health centers (CHCs). In 2008, 62% of the 1.1 billion ambulatory care visits were made to primary care delivery sites (5-7). Although primary care may be provided by any specialty, our analysis is limited to visits to office-based physicians, CHC providers, and OPD clinics specializing in internal medicine, family or general practice, general pediatrics, and general obstetrics and gynecology.

**Keywords:** physician offices • hospital outpatient departments • community health centers

### CHCs and OPDs are important sources of primary care for poor populations.

Figure 1. Percent distribution of visits to primary care sites, by setting and poverty level in patients' ZIP Code, United States, 2008

NOTE: Ambulatory setting was significantly associated with poverty level ( $p < 0.05$ ,  $p < 0.001$ , and  $p < 0.001$ ). Poverty level estimates exclude 4.3% of visits missing patients' ZIP Code.

## Medical Care Survey: Primary Care

David A. Woodward, B.A., and  
National Center for Health Care Statistics

### Introduction

The National Ambulatory Medical Care Survey (NAMCS), which began in 1973, was inaugurated to gather, analyze, and disseminate information about the health care provided by office-based physicians. Ambulatory medical care is the predominant method of providing health care services in the United States, and occurs in a wide range of settings.

Ambulatory medical care by physician offices is the largest and most widely used segment of the American health care system (1), and in 2004 accounted approximately 25 percent of health care spending (2). Physician offices comprised about four-fifths of all ambulatory medical care delivered in 2008, and physician consultation services included everything from primary care to highly specialized surgical and medical care. This report describes care delivered in the offices of nonfederally employed physicians. It includes visits not only to private practices but also to other settings, such as community clinics—including urgent

# The Treatment of Smoking by US Physicians During Ambulatory Visits: 1994–2003

| Anne N. Thorndike, MD, MPH, Susan Regan, PhD, and Nancy A. Rigotti, MD

Cigarette smoking is a leading cause of mortality in the United States. Strong evidence indicates that interventions at the physician level to encourage smoking cessation had low rates of success. The National Ambulatory Medical Care Survey (NAMCS) identified patients who had low rates of smoking cessation during outpatient visits. Since the late 1990s, national efforts by physicians to encourage cessation of tobacco use have been limited. This evidence-based review of the treatment of smoking by physicians identified every

## Use Of Medical Care For Chronic Conditions

The locus of care for chronic conditions is increasingly in the ambulatory sector.

by Sandra L. Decker, Susan M. Schappert, and Jane E. Sisk

## Trends in Opioid Prescribing by Race/Ethnicity for Patients Seeking Care in US Emergency Departments

**JAMA**

Mark J. Pletcher, MD, MPH  
Stefan G. Kertesz, MD, MSc  
Michael A. Kohn, MD, MPP  
Ralph Gonzales, MD, MSPH

**I**NADEQUATELY TREATED PAIN IS A MAJOR public health problem in the United States<sup>1</sup> and a particular problem in emergency departments.<sup>2</sup> Patients usually present to the emergency department when other medical help is not accessible or when symptoms, often including pain, are most severe. Emergency department visits therefore represent high-risk encounters in which assessment and treatment of pain should receive careful attention.<sup>2</sup>

**Context** National quality improvement initiatives implemented in the late 1990s were followed by substantial increases in opioid prescribing in the United States, but it is unknown whether opioid prescribing for treatment of pain in the emergency department has increased and whether differences in opioid prescribing by race/ethnicity have decreased.

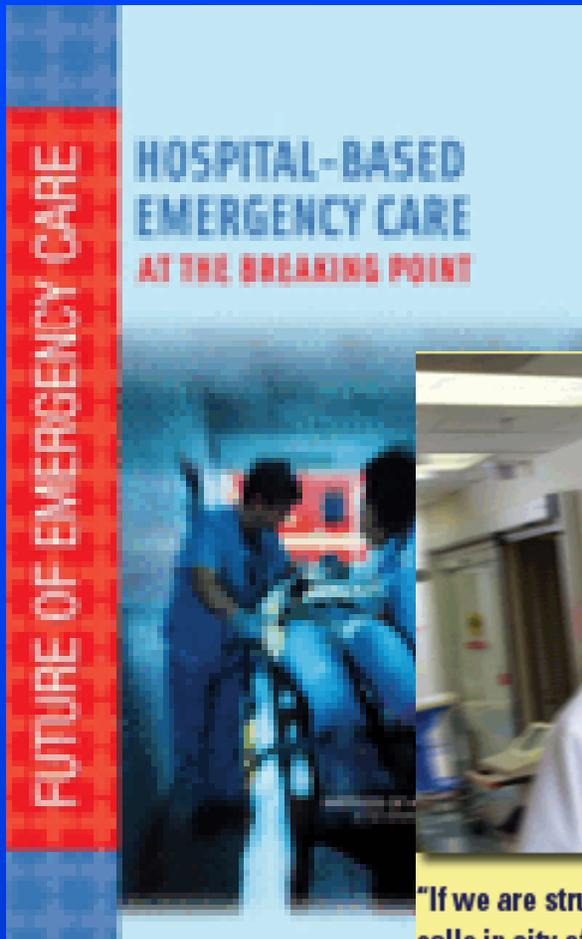

**Objectives** To determine whether opioid prescribing in emergency departments has increased, whether non-Hispanic white patients are more likely to receive an opioid than other racial/ethnic groups, and whether differential prescribing by race/ethnicity has diminished since 2000.

**Design and Setting** Pain-related visits to US emergency departments were identified using reason-for-visit and physician diagnosis codes from 13 years (1993-2005) of the National Hospital Ambulatory Medical Care Survey.

**Main Outcome Measure** Prescription of an opioid analgesic.

**Results** Pain-related visits accounted for 156 729 of 374 891 (42%) emergency department visits. Opioid prescribing for pain-related visits increased from 23% (95% confidence interval [CI], 21%-24%) in 1993 to 37% (95% CI, 34%-39%) in 2005 ( $P < .001$  for trend), and this trend was more pronounced in 2001-2005 ( $P = .02$ ). Over all years, white patients with pain were more likely to receive an opioid (31%) than black (23%), Hispanic (24%), or Asian/other patients (28%) ( $P < .001$  for trend), and differences did not diminish over

# Reports on Emergency Care

**"If we are struggling to deal with tonight's 911 calls in city after city across the United States, how in the world are we supposed to handle an epidemic of pandemic flu or a major terrorist attack or the next natural disaster?"**

74.1 M (33.9%) 39.4 M (35.0%) 32.7% 52.0%

#### Hospital Discharges/Ambulatory Care Visits/Nursing Home Visits

- From 1996–2006, the number of inpatient discharges from short-stay hospitals with CVD as the first listed diagnosis increased from 6,107,000 to 6,161,000 discharges. In 2006, CVD ranked highest among all disease categories in hospital discharges. (2006 National Hospital Discharge Survey, National Health Statistics Reports, No. 5.)
- In 2007, there were 79,697,000 physician office visits, hospital emergency department visits and outpatient visits with a primary diagnosis of CVD. (National Ambulatory Medical Care Survey: 2007 Summary.)
- In 2007, there were 4,048,000 visits to emergency departments with a primary diagnosis of CVD. (National Ambulatory Medical Care Survey: 2007 Emergency Department Summary.)
- In 2007, there were 7,929,000 outpatient department visits with a primary diagnosis of CVD. (Vital Health Stat 13, June 2009, [167]:1-155.)
- In 2005, about one of every six hospital stays was due to CVD. (AHRQ, NIS)

# Keeping Surveys Relevant

## Challenges

- Continually updating survey design, content, and analyses to address policy and research needs
- Improving coverage of providers and clinical management

## Opportunities

- Incredible recent interest in our data, as seen in ACA support
- New analyses from our new and consolidated surveys
- Maximizing flexibility/updating survey content
- Greater geographic precision of estimates
- Continued outreach yields new support and collaborations

# Keeping Surveys Timely

## Challenges

- Making data available as soon as possible
- Producing optimal data products

## Opportunities

- Upgrade to computer-assisted data collection will improve timeliness and efficiency
- Release of selected ambulatory provider-level estimates earlier
- New analytic tools and focused publications

# Electronic Health Records

## Challenges

- Collecting data during providers' transition from paper to electronic medical records
- Extracting data from electronic systems
- Providing meaningful data on the role of electronic health records in changing health care environment

## Opportunities

- New /expanded surveys about adoption of EHRs
- Gaining new experience in collecting and processing electronic data directly

# Hiring and Retaining Staff

## Challenges

- Vacancies slow down our efforts to cover workload
- Highly specific set of desired skills makes it difficult to find candidates

## Opportunities

- Survey operations remain top priority
- Some hiring authority granted, more hopefully coming; contractors helping
- Investment in training current staff

# Fostering a Culture of Innovation

## Challenge:

- Developing a working environment that encourages creativity and new ways to accomplish our goals

## Opportunity

- Component of the Division Strategic Plan
- Keep monitoring employee perceptions of innovation
- “Issues in Health Care Statistics” and other forums to exchange ideas

# Data Quality

## Challenges

- No recent reabstraction to assess data quality because of funding constraints
- Infrequent training of field representatives

## Opportunities

- Reabstraction studies in NAMCS and NHCS
- Development of long-term methodological agenda
- More systematic testing of new survey items and additional collaborations with QDRL

# Response Rates

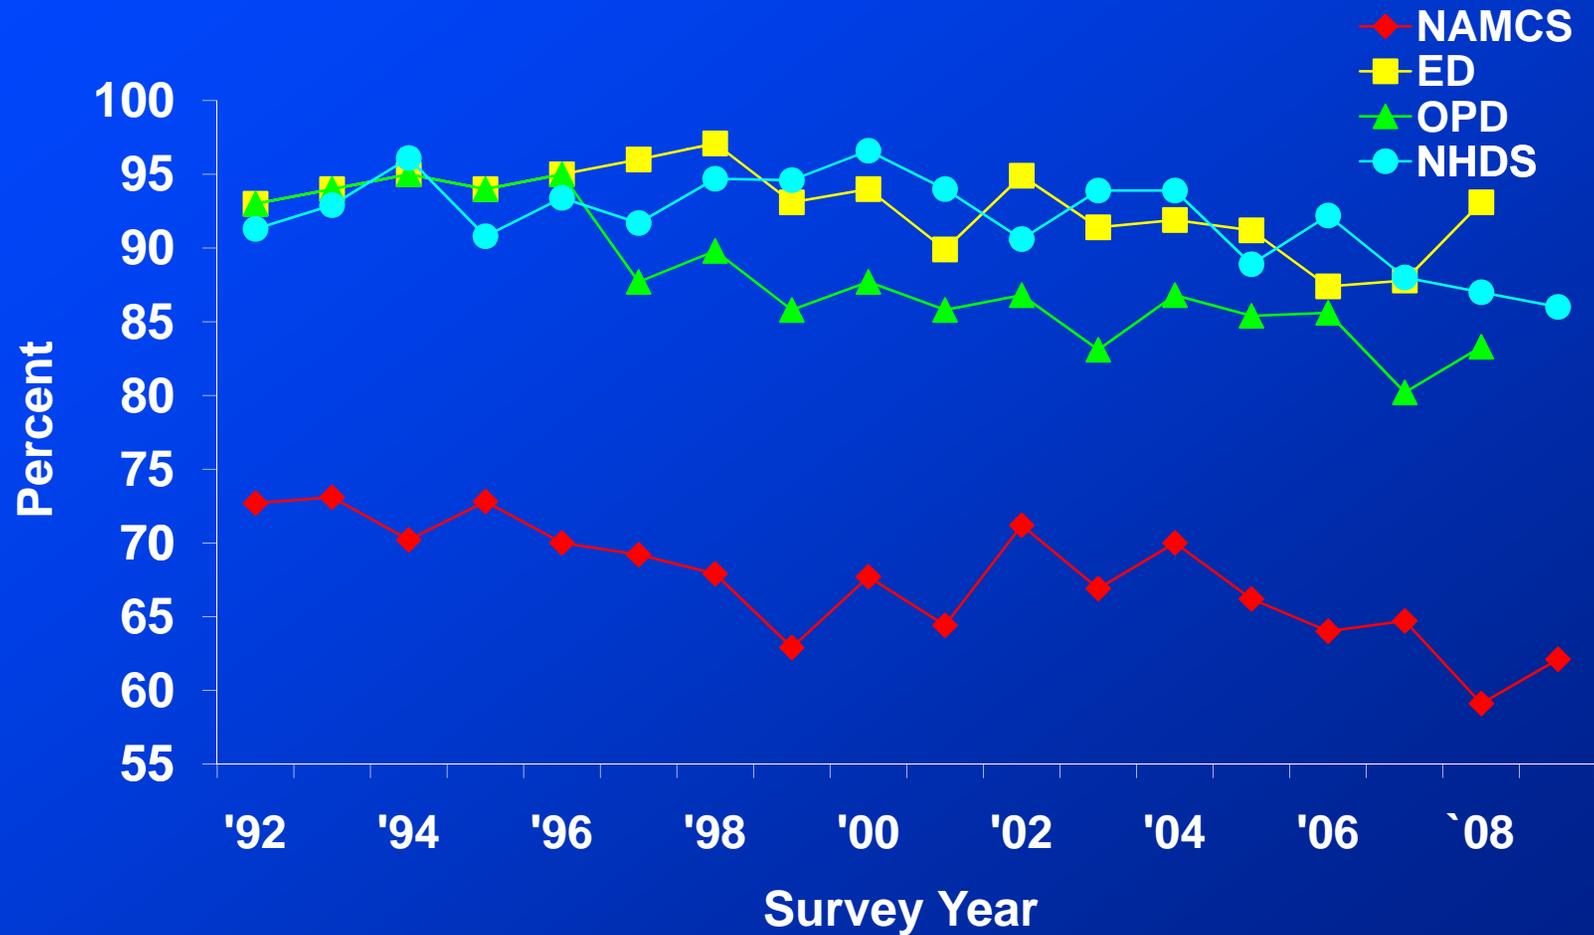

## Challenges

- NAMCS response rates difficult to maintain
- Recruiting hospitals for NHCS

## Opportunities

- Non-response follow-up studies
- Further outreach to provider associations
- Reducing burden through move to FR abstraction and electronic data transmission
- Fresh samples

# Response Rates for NAMCS, NHAMCS, and NHDS

Note: ED & OPD response rates for the years 1992-96 were calculated as one rate.  
Response rates are unweighted.

# Sustainable Funding

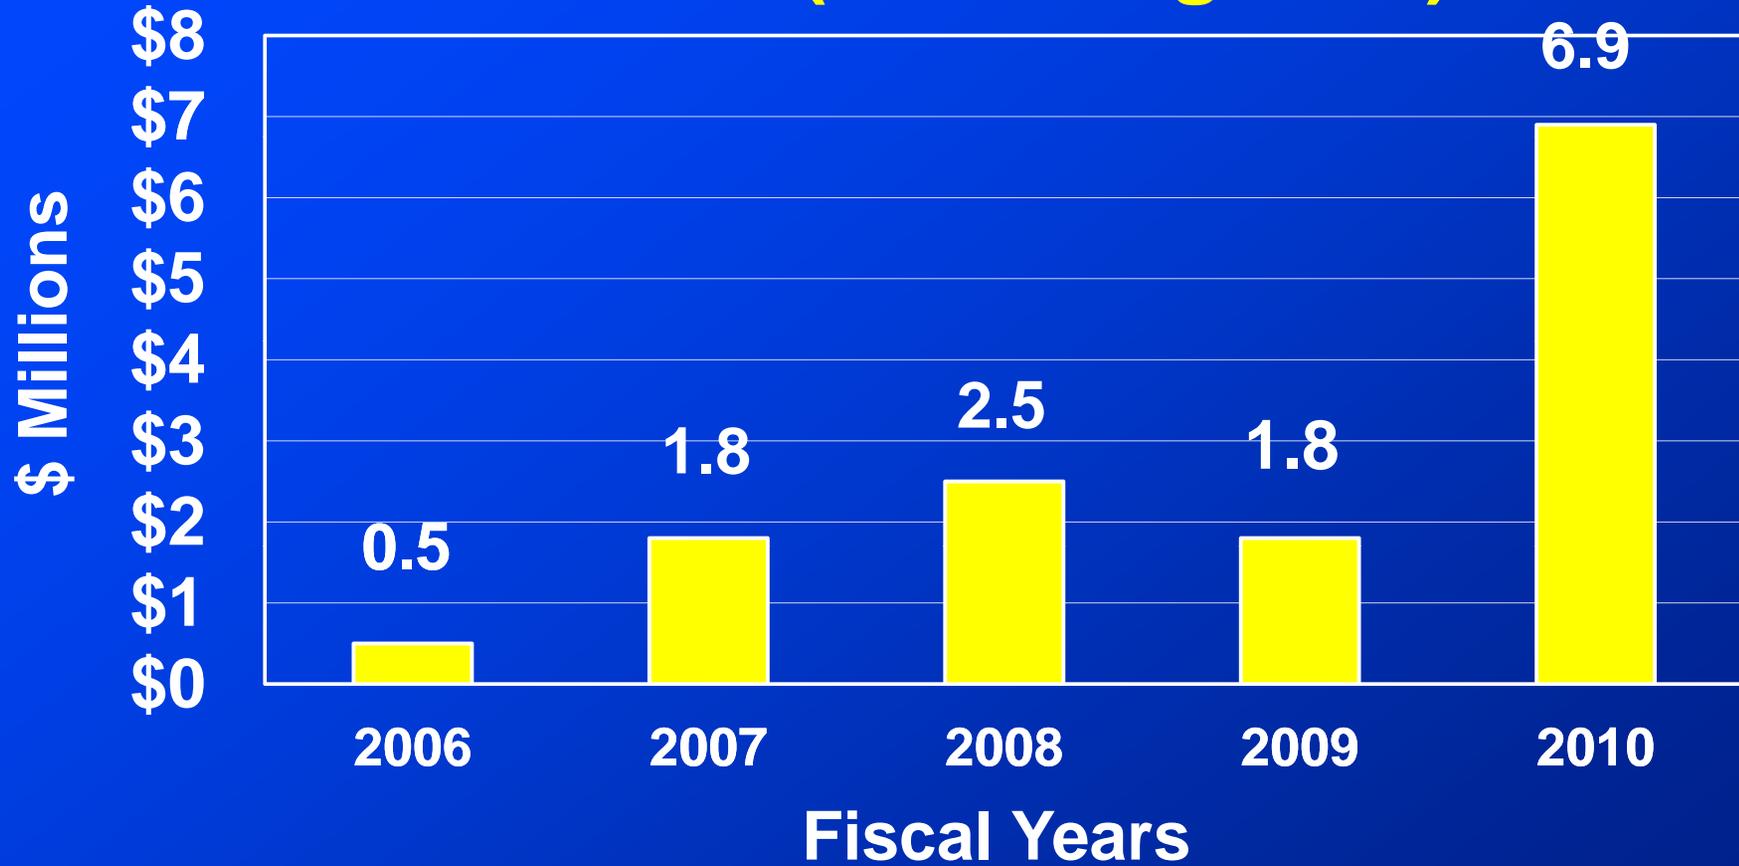

## Challenges

- Years of uncertain funding led to delays, cancellations of data collections, and inability to make vital improvements
- External support remains uncertain year to year
- External support also means additional work in most cases

## Opportunities

- Maximizing our benefit from current funding boom with long-term investments
- Continued outreach to potential sponsors

# External Support Funds, Fiscal Years 2006-2010 (excluding ACA)

# Questions and Comments?
