# Prevalence of Overweight, Obesity, and Severe Obesity Among Adults Aged 20 and Over: United States, 1960-1962 Through 2017-2018 

by Cheryl D. Fryar, M.S.P.H., Margaret D. Carroll, M.S.P.H., and Joseph Afful, M.S., Division of Health and Nutrition Examination Surveys

Results from the 2017-2018 National Health and Nutrition Examination Survey (NHANES), using measured heights and weights, indicate that an estimated $42.5 \%$ of U.S. adults aged 20 and over have obesity, including $9.0 \%$ with severe obesity, and another $31.1 \%$ are overweight. Body mass index (BMI), expressed as weight in kilograms divided by height in meters squared $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$, is used commonly to classify overweight (BMI 25.0-29.9), obesity (BMI at or above 30.0), and severe obesity (BMI at or above 40.0).

Age-adjusted trends in overweight, obesity, and severe obesity prevalence from 1960-1962 through 2017-2018 are shown in Table 1. Because surveys before 1988 did not include persons over age 74, Table 1 shows the prevalence for adults aged 20 and over since 1988, and for adults aged 20-74 for all survey periods dating back to 1960 . The age-adjusted sex-specific trends of overweight, obesity, and severe obesity among adults aged 20-74 from 1960-1962 through 2017-2018 are shown in the Figure. Table 2 contains the prevalence of obesity by age for men and women since 1988-1994, and Table 3 contains the age-adjusted prevalence of obesity by race and Hispanic origin for men and women since 1988-1994.

The prevalence of obesity as measured by BMI among non-Hispanic Asian adults is consistently lower than that reported for non-Hispanic white, non-Hispanic black, and Hispanic adults. Although BMI is widely used as a measure of body fat, at a given BMI level, body fat may vary by sex, age, and race and Hispanic origin. In particular, research suggests that health risks may begin at a lower BMI among Asian persons compared with others $(1,2)$.

NHANES, conducted by the National Center for Health Statistics, is a stratified, multistage probability sample of the civilian noninstitutionalized population of the United States. The survey began oversampling non-Hispanic Asian persons in 2011-2012 and the total Hispanic population in 2007-2008. Beginning in 2007-2008, Mexican-American persons were no longer oversampled but are included in the oversampled total Hispanic population.

A household interview and a physical examination are conducted for each survey participant. During the physical examination, conducted in a mobile examination center, height and weight are measured as part of a comprehensive set of body measurements. These measurements are taken by trained health technicians, using standardized measuring procedures and equipment. Observations for pregnant women and for persons missing a valid height or weight measurement are not included in the data analysis.

Figure. Age-adjusted trends in overweight, obesity, and severe obesity among men and women aged 20-74: United States, 1960-1962 through 2017-2018

NOTES: Data are age adjusted by the direct method to U.S. Census 2000 estimates using age groups 20-39, 40-59, and 60-74. Overweight is body mass index (BMI) of $25.0-29.9 \mathrm{~kg} / \mathrm{m}^{2}$. Obesity is BMI at or above $30.0 \mathrm{~kg} / \mathrm{m}^{2}$. Severe obesity is BMI at or above $40.0 \mathrm{~kg} / \mathrm{m}^{2}$. Pregnant women are excluded from the analysis.

${ }^{1}$ Age adjusted by the direct method to the U.S. Census 2000 estimates using the age groups 20-39, 40-59, and 60 and over. Crude estimates (not age adjusted) for $2017-2018$ are $31.1 \%$ for overweight, $42.5 \%$ for obesity, and $9.0 \%$ for severe obesity categories.
${ }^{2}$ Age adjusted by the direct method to the U.S. Census 2000 estimates using the age groups 20-39, 40-59, and 60-74. The 1960-1962 National Health Examination Survey included adults aged 18-79, and the 1971-1974 and 1976-1980 National Health and Nutrition Examination Surveys did not include individuals over age 74.
NOTES: Overweight is body mass index (BMI) of $25.0-29.9 \mathrm{~kg} / \mathrm{m}^{2}$, obesity is BMI at or above $30.0 \mathrm{~kg} / \mathrm{m}^{2}$, and severe obesity is BMI at or above $40.0 \mathrm{~kg} / \mathrm{m}^{2}$. Pregnant women are excluded from the analysis.
