Map 22–1. Persons (13+ years) with a Diagnosis of AIDS within 3 Months of Diagnosis of HIV Infection, by State: 2013 22–12
Goal: Prevent human immunodeficiency virus (HIV) infection and its related illness and death.

This chapter includes objectives that monitor efforts to reduce new HIV infections, increase HIV testing and prevent HIV risk, and increase access to care and improve health outcomes for people living with HIV. The Reader’s Guide provides a step-by-step explanation of the content of this chapter, including criteria for highlighting objectives in the Selected Findings.1

Status of Objectives

Of the 27 objectives in the HIV Topic Area, 11 objectives were archived,2 5 were developmental,3 and 11 were measurable4 (Figure 22–1, Table 22–1). The midcourse status of the measurable objectives (Table 22–2) was as follows:

- 2 objectives had met or exceeded their 2020 targets,5
- 5 objectives were improving,6
- 3 objectives demonstrated little or no detectable change,7 and
- 1 objective had baseline data only.8

Selected Findings

Reduce New HIV Infections

- There was little or no detectable change (48,600 in 2006 and 47,500 in 2010) in the number of new HIV infections among adolescents and adults aged 13 and over (Table 22–2, HIV-2).9

- Between 2006 and 2010, the HIV transmission rate (HIV-3) decreased from 4.6 to 4.2 new infections per 100 adolescents and adults aged 13 and over living with HIV, moving toward the 2020 target (Table 22–2).9

- From 2008 to 2011, the number of newly diagnosed perinatally acquired HIV cases (HIV-8.1) declined from 255 to 187, exceeding the 2020 target (Table 22–2).

Increase HIV Testing and Prevent HIV Risk

Four of the seven measurable objectives monitoring HIV testing and risk had improved at midcourse, and two demonstrated little or no detectable change. One objective had baseline data only, so progress toward the 2020 target could not be assessed (Table 22–2).

- Between 2008 and 2013, the proportion of persons aged 13 and over who had a diagnosis of AIDS within 3 months of diagnosis of HIV infection (HIV-9) decreased from 25.9% to 23.6%, moving toward the 2020 target (Table 22–2).
The proportion of persons aged 13 and over who had a diagnosis of AIDS within 3 months of diagnosis of HIV infection (HIV-9) varied by state. Three states (Oklahoma, Utah, and Virginia) and the District of Columbia had met or exceeded the national target in 2013 (Map 22–1).

In 2013, the disparities by sex and race in the proportion of persons aged 13 and over who had an AIDS diagnosis within 3 months of diagnosis of HIV infection (HIV-9) were not tested for statistical significance (Table 22–3).

The proportion of HIV-positive persons aged 13 and over who knew their serostatus (HIV-13) increased from 80.9% in 2006 to 87.2% in 2012, moving toward the 2020 target (Table 22–2).

In 2012, the disparities by sex and race in the proportion of HIV-positive persons aged 13 and over who knew their serostatus (HIV-13) varied by state. In 2012, eleven states had met or exceeded the national target: Alaska, Connecticut, Delaware, Hawaii, Idaho, Maine, Montana, North Dakota, New Hampshire, New York, and Vermont (Map 22–2).

In 2012, the disparities by sex and race in the proportion of HIV-positive persons aged 13 and over who were aware of their HIV infection status (HIV-13) were not tested for statistical significance (Table 22–3).

The proportion of adolescents and adults aged 15–44 who had been tested for HIV in the past 12 months (HIV-14.1) increased from 66.9% in 2006–2010 to 69.9% in 2011–2013, moving toward the 2020 target (Table 22–2).

In 2011–2013, there were statistically significant disparities by sex, race and ethnicity, and family income in the proportion of adolescents and adults aged 15–44 who had been tested for HIV in the past 12 months (Table 22–3, HIV-14.1). The disparities by education, disability status, and geographic location were not statistically significant.

There was little or no detectable change (72.0% in 2006–2010 and 73.9% in 2011–2013) in the proportion of pregnant women aged 15–44 who had been tested for HIV in the past 12 months (Table 22–2, HIV-14.3).

In 2011–2013, there was a statistically significant disparity by race and ethnicity in the proportion of pregnant women aged 15–44 who had been tested for HIV in the past 12 months (Table 22–3, HIV-14.3). The disparities by education, family income, disability status, and geographic location were not statistically significant.

From 2008 to 2013, the proportion of substance abuse treatment facilities that offered HIV/AIDS counseling, education, and support (HIV-16) increased from 61.2% to 64.8%, moving toward the 2020 target (Table 22–2).

### Increase Access to Care and Improve Health Outcomes for People Living With HIV

Between 2007 and 2013, the age-adjusted HIV infection death rate (HIV-12) decreased from 3.7 to 2.1 per 100,000 population, exceeding the 2020 target (Table 22–2).

In 2013, the age-adjusted HIV infection death rate (HIV-12) varied by state. Thirty states had met or exceeded the national target (Map 22–3).

In 2013, there were statistically significant disparities by sex, race and ethnicity, and geographic location in the age-adjusted HIV infection death rate (Table 22–3, HIV-12).

### More Information

Readers interested in more detailed information about the objectives in this topic area are invited to visit the HealthyPeople.gov website, where extensive substantive and technical information is available:

For the background and importance of the topic area, see: [http://www.HealthyPeople.gov/2020/topics-objectives/topic/hiv](http://www.HealthyPeople.gov/2020/topics-objectives/topic/hiv)

For data details for each objective, including definitions, numerators, denominators, calculations, and data limitations, see: [http://www.HealthyPeople.gov/2020/topics-objectives/topic/hiv/objectives](http://www.HealthyPeople.gov/2020/topics-objectives/topic/hiv/objectives).

Select an objective, then click on the “Data Details” icon.

For objective data by population group (e.g., sex, race and ethnicity, or family income), including rates, percentages, or counts for multiple years, see: [http://www.HealthyPeople.gov/2020/topics-objectives/topic/hiv/objectives](http://www.HealthyPeople.gov/2020/topics-objectives/topic/hiv/objectives).

Select an objective, then click on the “Data2020” icon.

Data for the measurable objectives in this chapter were from the following data sources:

Footnotes

1 The Technical Notes provide more information on Healthy People 2020 statistical methods and issues.

2 Archived objectives are no longer being monitored due to lack of data source, changes in science, or replacement with other objectives.

3 Developmental objectives did not have a national baseline value.

4 Measurable objectives had a national baseline value.

5 Target met or exceeded—One of the following, as specified in the Midcourse Progress Table:
   » At baseline the target was not met or exceeded and the midcourse value was equal to or exceeded the target. (The percentage of targeted change achieved was equal to or greater than 100%.)
   » The baseline and midcourse values were equal to or exceeded the target. (The percentage of targeted change achieved was not assessed.)

6 Improving—One of the following, as specified in the Midcourse Progress Table:
   » Movement was toward the target, standard errors were available, and the percentage of targeted change achieved was statistically significant.
   » Movement was toward the target, standard errors were not available, and the objective had achieved 10% or more of the targeted change.

7 Little or no detectable change—One of the following, as specified in the Midcourse Progress Table:
   » Movement was toward the target, standard errors were available, and the percentage of targeted change achieved was not statistically significant.
   » Movement was toward the target, standard errors were not available, and the objective had achieved less than 10% of the targeted change.
   » Movement was away from the baseline and target, standard errors were available, and the percentage change relative to the baseline was not statistically significant.
   » Movement was away from the baseline and target, standard errors were not available, and the objective had moved less than 10% relative to the baseline.
   » There was no change between the baseline and the midcourse data point.

8 Baseline only—The objective only had one data point, so progress toward target attainment could not be assessed.

9 To align with the National HIV/AIDS Strategy updated to 2020 (NHAS 2020), this indicator will be retired.

10 HIV case surveillance data are counts of HIV infections diagnosed in the US and 6 dependent areas; they are not a sample so testing for statistical significance is not appropriate.

Table 22–2. Midcourse Progress for Measurable1 HIV Objectives—Continued

NOTES
See HealthyPeople.gov for all Healthy People 2020 data. The Technical Notes provide more information on the measures of progress.

FOOTNOTES

1 Measurable objectives had a national baseline value.

Target met or exceeded:
2 At baseline the target was not met or exceeded and the midcourse value was equal to or exceeded the target. (The percentage of targeted change achieved was equal to or greater than 100%.)
3 The baseline and midcourse values were equal to or exceeded the target. (The percentage of targeted change achieved was not assessed.)

Improving:
4 Movement was toward the target, standard errors were available, and the percentage of targeted change achieved was statistically significant.
5 Movement was toward the target, standard errors were not available, and the objective had achieved 10% or more of the targeted change.

Little or no detectable change:
6 Movement was toward the target, standard errors were available, and the percentage of targeted change achieved was not statistically significant.
7 Movement was toward the target, standard errors were not available, and the objective had achieved less than 10% of the targeted change.
8 Movement was away from the baseline and target, standard errors were available, and the percentage change relative to the baseline was not statistically significant.
9 Movement was away from the baseline and target, standard errors were not available, and the objective had moved less than 10% relative to the baseline.
10 There was no change between the baseline and the midcourse data point.

Getting worse:
11 Movement was away from the baseline and target, standard errors were available, and the percentage change relative to the baseline was statistically significant.
12 Movement was away from the baseline and target, standard errors were not available, and the objective had moved 10% or more relative to the baseline.
13 Baseline only: The objective only had one data point, so progress toward target attainment could not be assessed.

INFOGRAPHIC

Informational: A target was not set for this objective, so progress toward target attainment could not be assessed.

For objectives that moved toward their targets, movement toward the target was measured as the percentage of targeted change achieved (unless the target was already met or exceeded at baseline):

\[
\text{Percentage of targeted change achieved} = \frac{\text{Midcourse value} - \text{Baseline value}}{\text{HP2020 target} - \text{Baseline value}} \times 100
\]

For objectives that moved away from their baselines and targets, movement away from the baseline was measured as the magnitude of the percentage change from baseline:

\[
\text{Magnitude of percentage change from baseline} = \frac{|\text{Midcourse value} - \text{Baseline value}|}{\text{Baseline value}} \times 100
\]

Statistical significance was tested when the objective had a target and at least two data points, standard errors of the data were available, and a normal distribution could be assumed. Statistical significance of the percentage of targeted change achieved or the magnitude of the percentage change from baseline was assessed at the 0.05 level using a normal one-sided test.

Table 22–3. Midcourse Health Disparities\(^1\) for Population-based HIV Objectives—Continued

NOTES

See HealthyPeople.gov for all Healthy People 2020 data. The Technical Notes provide more information on the measures of disparities.

FOOTNOTES

\(^1\)Health disparities were assessed among population groups within specified demographic characteristics (sex, race and ethnicity, educational attainment, etc.). This assessment did not include objectives that were not population-based, such as those based on states, worksites, or those monitoring the number of events.

\(^2\)When there were only two groups (e.g., male and female), the summary disparity ratio was the ratio of the higher to the lower rate.

\(^3\)When there were three or more groups (e.g., white non-Hispanic, black non-Hispanic, Hispanic) and the most favorable rate \((R_f)\) was the highest rate, the summary disparity ratio was calculated as \(R_f / R_h\), where \(R_h\) = the average of the rates for all other groups. When there were three or more groups and the most favorable rate was the lowest rate, the summary disparity ratio was calculated as \(R_f / R_h\).

\(^4\)Unless otherwise footnoted, data do not include persons under age 25 years.

\(^5\)Unless otherwise footnoted, the poor, near-poor, middle, near-high, and high income groups are for persons whose family incomes were less than 100%, 100%–199%, 200%–399%, 400%–599%, and at or above 600% of the poverty threshold, respectively.

FOOTNOTES—Continued

\(^1\)The summary disparity ratio was not tested for statistical significance because standard errors of the data were not available or normality on the natural logarithm scale could not be assumed.

\(^2\)The summary disparity ratio was significantly greater than 1.000. Statistical significance was assessed at the 0.05 level using a normal one-sided test on the natural logarithm scale.

\(^3\)Data include persons of Hispanic origin.

\(^4\)Data are for persons whose family income was 400% to 499% of the poverty threshold.

\(^5\)Data are for persons whose family income was 500% or more of the poverty threshold.

\(^6\)Data are for Asian or Pacific Islander persons.

DATA SOURCES

HIV-9 National HIV Surveillance System (NHSS), CDC/NCHHSTP
HIV-12 National Vital Statistics System–Mortality (NVSS–M), CDC/NCHS
HIV-13 National HIV Surveillance System (NHSS), CDC/NCHHSTP
HIV-14.1 National Survey of Family Growth (NSFG), CDC/NCHS
HIV-14.3 National Survey of Family Growth (NSFG), CDC/NCHS
Map 22–1. Persons (13+ years) with a Diagnosis of AIDS within 3 Months of Diagnosis of HIV Infection, by State: 2013

Healthy People 2020 Objective HIV-9 ● National Target = 20.8% ● National Rate = 23.6%

NOTES: Data are for persons aged 13 years and over with stage 3 HIV (AIDS) diagnosis, based on first CD4 test performed or documentation of an AIDS-defining condition 3 months or less after a diagnosis of HIV infection. Data are displayed by a modified Jenks classification for U.S. states, which creates categories that minimize within-group variation and maximize between-group variation. The Technical Notes provide more information on the data and methods.

DATA SOURCE: National HIV Surveillance System (NHSS), CDC/NCHHSTP
Map 22–2. Knowledge of Serostatus Among HIV-positive Persons (13+ years), by State: 2012

Healthy People 2020 Objective HIV-13 ● National Target = 90.0% ● National Rate = 87.2%

NOTES: Data are estimated number of persons living with HIV infection as of the end of 2012. Estimates were derived by using extended back-calculation on HIV and AIDS data for persons aged 13 years and over at diagnosis from 46 states that have had confidential name-based HIV infection reporting since at least January 2007, and AIDS data from 5 areas (Hawaii, Maryland, Massachusetts, Vermont, and the District of Columbia). Data are displayed by a modified Jenks classification for U.S. states, which creates categories that minimize within-group variation and maximize between-group variation. The Technical Notes provide more information on the data and methods.

DATA SOURCE: National HIV Surveillance System (NHSS), CDC/NCHHSTP

Healthy People 2020 Objective HIV-12 ● National Target = 3.3 per 100,000 population ● National Rate = 2.1 per 100,000 population

NOTES: Death rates are calculated based on the resident population of the United States for 2013. Data are age-adjusted to the 2000 standard population. Postcensal population estimates are used in rate calculations for years after a census year and match the data year vintage estimates (e.g., July 1, 2011 resident population estimates from Vintage 2011 are used as the denominator for 2011 rates). Data are displayed by a modified Jenks classification for U.S. states, which creates categories that minimize within-group variation and maximize between-group variation. The Technical Notes provide more information on the data and methods.
