## Table 111 (page 2 of 2). Gross domestic product, national health expenditures, per capita amounts, percent distribution, and average annual percent change: United States, selected years 1960-2011

Updated data when available, Excel, PDF, and more data years: http://www.cdc.gov/nchs/hus/contents2012.htm#111.

[Data are compiled from various sources by the Centers for Medicare & Medicaid Services]

- - - Data not available.

. Category not applicable. <sup>1</sup>Year 2005 = 100.

<sup>2</sup>Investment consists of research and structures and equipment. <sup>3</sup>See Appendix II, Average annual rate of change (percent change).

NOTES: Dollar amounts shown are in current dollars. Deflating health care spending separates the effects of price growth from growth attributable to all other factors. The dollar value of these estimates of real health care expenditures is determined by the index(es) chosen to remove price growth from spending. One approach to deflating health spending is to remove the effects of economy-wide inflation alone using the GDP deflator. An alternative approach to removing the effects of price growth from health spending for the National Health Expenditure Accounts is to deflate health care expenditures by a measure of medical specific price inflation. For personal health care (PHC) spending, this would involve directly deflating expenditures by price indexes associated with the services and goods provided; for non-PHC spending this would involve deflating by composite indexes matching the components of spending for each category. For more information on the detailed price series recommended for deflating each category of spending, see the National Health Expenditure Accounts Methodology Paper, 2011. Available from: http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/Downloads/dsm-11.pdf. The data reflect preliminary annual estimates of the resident population of the United States as of July 1, 2011, excluding the Armed Forces overseas. See Appendix II, Gross domestic product (GDP); Health expenditures, national. Percents are calculated using unrounded data. Estimates may not add to totals because of rounding. Starting with Health, United States, 2010, estimates are based on a revised methodology that incorporates available source data and various methodological and definitional changes. These revisions are due to a comprehensive change in the classification structure of how estimates are defined and presented. For more information on the impact of these revisions, see: http://www.cms.gov/NationalHealthExpendData/downloads/benchmark2009.pdf. Data have been revised and differ from previous editions of Health, United States.
