### FOREWORD

The infrastructure of civil registration and vital statistics (CR/VS) systems can be quite complex and the organizational patterns varies greatly among countries. Although the United Nations Statistical Division had previously conducted questionnaire surveys to ascertain the organization structure of CR/VS systems, in 1984 the IIVRS made a limited survey to broaden the coverage of information on national CR/VS systems. The results of that survey were reported in the IIVRS Technical Papers No. 29 in 1986. In 1994, another questionnaire survey was conducted to update the information obtained a decade earlier. This survey also provided an opportunity to obtain data for the newly established nations of the former USSR and eastern Europe. This paper is essentially an update of the study published in Technical Paper No. 29.

There are no restrictions on the use of material published by the IIVRS. Material from this publication may be quoted or duplicated without permission.

The program of the International Institute for Vital Registration and Statistics, including the publication and distribution of the Technical Papers, is supported by a grant from the United Nations Population Fund.

ORGANIZATION OF NATIONAL CIVIL REGISTRATION  
AND VITAL STATISTICS SYSTEMS: AN UPDATE

For international comparison of vital statistics, it is imperative that the same definitions of vital events be adopted by each country. The data should also be classified in the same manner, and the basic tabulations must be the same for comparative purposes. International definitions and the statistical conventions adopted over the years have done much to bring about uniformity in definitions and classification of data.

To produce uniform statistics, the registration practices will also need to be the same within and between countries. Coordination within countries is exercised by the national registration office in countries where the registration system is centralized and by the national vital statistics office in countries where the registration system is decentralized. On the other hand, there is no mechanism for achieving uniformity of registration practices between countries aside from the international statistics conventions.

In all countries, the informant designated by law notifies the local registrar and provides demographic and other information about the vital event. These data are entered in the register and stored for retrieval until a request is received for a certified copy of the record. The local registrar also prepares a copy of the record for statistical purposes and transmits it to the vital statistics agency. Compilations of vital statistics are made at the State and/or National office of vital statistics.

By and large, the civil registration and vital statistics functions and procedures are relatively simple and do not differ greatly between countries. On the other hand, the infrastructure of the civil registration and vital statistics system can be quite complex and the organizational pattern varies greatly between countries.

To ascertain the organizational structure and national registration and vital statistics practices, the United Nations Statistical Division has conducted questionnaire surveys of the sources of vital statistics. The last such survey was undertaken between November 1976 and April 1979. In 1984, the IIVRS made a limited survey to broaden the coverage of information on national civil registration and vital statistics systems. The results of this survey were reported in the IIVRS Technical Papers No. 29, 1986. Although the quality of response was generally good, this survey showed how difficult it was to obtain a satisfactory response rate.

In 1994, another questionnaire survey was conducted to update the information obtained some 10 years before. This survey also provided an opportunity to obtain data for the newly established republics of the former U.S.S.R. and eastern Europe.

This report is essentially an update of the study of the organization of national civil registration and vital statistics systems based on a questionnaire survey made in 1984. At that time, a civil registration

FEB 27 1996

questionnaire and a vital statistics questionnaire were sent to the respective offices represented in the IIVRS membership. Three follow ups were made over a period of 7 to 8 months. The quality of responses received was generally good, but the response rate, especially on the civil registration questionnaire was poor (less than 50 percent). It was felt, at that time, that the poor response rate was due to the difficulty of identifying all the national civil registration offices. Another possible reason may have been a language problem. If the questionnaire had been framed in one of the official languages of the country, instead of English, a better response may have resulted.

Accordingly, the questionnaires for the present survey were prepared in English, French and Spanish. The first batch of questionnaires was sent out in March of 1994. A follow up was made about 7 months after the initial mailing. There was considerable improvement in the return of the questionnaire as compared with the previous survey. The response rate for the civil registration portion increased from 46.7 percent in 1984 to 69.8 percent in 1994. The corresponding figures for the vital statistics questionnaire were 69.5 percent in 1984 and 83.8 percent in 1994. These improvements took place despite the fact that only one follow up was made in the 1994 survey as compared with 3 follow ups in the 1984 round.

A good deal of information has been collected to date on the civil registration and vital statistics systems in the various countries. However, there are still 21 countries where nothing is known about the organization of the registration and vital statistics systems. In addition, there are 6 countries for which no information is available with respect to the registration of vital events. The next step is to obtain world-wide coverage of information on the organization of national civil registration and vital statistics systems.

As in the earlier survey, the response rate (Table 1) for the vital statistics questionnaire was significantly higher than that for civil registration. Also, there was considerable variation in the response rates by region. As expected, the response rate was high for the European countries. Almost all the vital statistics offices in North America returned completed questionnaires whereas most of the registration offices in the Caribbean area failed to respond.

TABLE 1. Questionnaire Response Rate in Percent

	Civil Registration	Vital Statistics
All regions	69.8	83.8
Africa	63.0	74.0
America, North	43.8	95.2
America, South	60.0	80.0
Asia	70.0	85.0
Europe	80.0	94.2
Oceania	75.0	79.2

## Organization of the Civil Registration System

A national registration system may be centralized or decentralized. In the decentralized system, there is no national registration office to oversee the national network of registration offices. This is the responsibility of the autonomous State or provincial authorities. The decentralized system of registration is found in countries with a federated form of government where there is a division of power between the federal and State governments. In these countries, the principal function of the national office is the compilation of national vital statistics. The national office of vital statistics is also charged with the responsibility for coordinating the activities of the registration offices in the autonomous states or provinces and for promoting the uniformity of registration practices and procedures. About 10 percent of the national civil registration systems are decentralized. The countries with a decentralized system may be identified in Appendix Table A by the absence of a national registration office.

In a centralized registration system, there is a national office over the State and local registration offices. This form of organization is found in countries where the powers of governance are centered in the national government. As may be seen in Table 2, the legal responsibility for civil registration in these countries is assumed by various ministries or departments. The principal ones are the Ministry of Interior (40 percent) and the Ministry of Justice (34 percent). In 11 percent of the countries, the Health Ministry is responsible for the registration function. These are logical choices. Because of the juridical uses of vital records, the Ministry of Justice would have considerable interest in the legal aspects of civil registration. The Ministry of Interior and the Ministry of Health are options for another reason. In the case of the Ministry of Interior, there is a national network of local government offices, whereas the Health Ministry will have, under its jurisdiction, community health centers and hospitals where births and deaths take place.

TABLE 2. MINISTRIES RESPONSIBLE FOR CIVIL REGISTRATION IN COUNTRIES WITH CENTRALIZED CIVIL REGISTRATION SYSTEMS BY REGION

	Interior	Justice	Health	Other
All regions	67 (40.3)	56 (33.7)	18 (10.8)	25 (15.1)
Africa	26 (54.2)	9 (18.8)	4 (8.3)	9 (18.8)
America, North	3 (13.6)	13 (59.1)	2 (9.1)	4 (18.2)
America, South	4 (40.0)	5 (50.0)	0 (0.0)	1 (10.0)
Asia	17 (41.5)	12 (29.3)	8 (19.5)	4 (9.8)
Europe	16 (29.9)	12 (35.3)	1 (2.9)	5 (14.7)
Oceania	1 (9.1)	5 (45.5)	3 (27.3)	2 (18.2)

Note: Percent in parenthesis

There are marked regional differences in the location of national registration offices. In over half of the African countries, the Home or Interior Ministry is responsible for civil registration whereas very few countries in North America and in Oceania reported to have the registration of vital events centered in the Ministry of Interior. In the Caribbean and

South American countries, and in Oceania, the Ministry of Justice is favored as the locus of responsibility for the civil registration function.

In many countries, civil registration is tied in organizationally with other government functions such as population registries, personal identification and maintenance of national electoral rolls, and compilation of national vital statistics. In such cases, it depends on the situation in the country as to where the registration function will be performed. For example, civil registration is part of the population registration program in the Ministry of Interior in Denmark, Finland and Israel. In Hungary, it is associated with population registration under the Board of Councils of the Council of Ministers, whereas in Norway and Sweden, they are in the Ministry of Finance.

In countries with a centralized system, the national registration office may have a direct line of authority over the local registration offices. This appears to be the situation in about 65 percent of the countries. In the rest of the countries, the national registration office gives advice and direction on technical matters to the personnel of the local registration offices under the administrative control of another ministry or department. This may make for a more complex administrative operation, especially if the local personnel also has responsibilities for functions other than civil registration which he regards as more important than the registration of vital events.

Another important aspect of the registration network is the location and number of local registration offices. It was not possible to get into the question of site of the registration offices, but information on the number of local registration offices was collected. There is a very large range in the number of local registration offices. Small countries like Macau, Hong Kong, Singapore, and Monaco which are essentially large cities have no need for an extensive network. Therefore, a few local registration offices can efficiently serve the public. On the other hand, most countries have the problem of reaching the rural population however remote. This requires many more local registration offices. The largest reported number is 225,000 by India. (No information is available for China or for the Russian republics.)

In terms of workload, the local registration offices or the local registrars in the rural areas of most countries have relatively little to do on matters concerning the registration of births and deaths. Theirs is a part time activity registering, on the average, fewer than one birth per day. Therefore, most of them do not regard registration to be an important part of their job. This poses a difficult management problem for the central registration office, especially where direct supervision of local registrars is not possible.

Although the public must have ready access to a local registration office, there appears to be too many local registration offices in most countries needed for an efficient operation. The question of setting up an optimum network of local registration offices needs to be studied on a country by country basis. In such a study, consideration should be given to the consolidation of local registration offices and the establishment of sub-registration offices. To reach remote and sparsely settled areas, the

possibility of having mobile units serve those areas should be considered.

### Organization of the Vital Statistics System

A central statistical office is responsible for the national compilation of vital statistics in most countries of the world. However, these statistical offices are located in various ministries (see Table 3), the chief among them being the Ministry of Finance and Economics (29 percent), and Ministry of Planning (26 percent). In about 11 percent of the countries, the central statistical office is under the jurisdiction of the Ministry of Interior where most of the national registration offices are located. In other countries, the central statistical offices are independent agencies or in the office of the President or Prime Minister. In about 14 percent of the countries, the compilation of national vital statistics is the responsibility of the Health Ministry.

TABLE 3. MINISTRIES RESPONSIBLE FOR VITAL STATISTICS BY REGION

	Planning	Finance and Economics	Interior	Health	Other
All regions	36 (25.7)	41 (29.3)	16 (11.4)	19 (13.6)	28 (20.0)
Africa	23 (51.1)	10 (22.2)	3 (6.7)	3 (6.7)	6 (13.3)
America, North	1 (4.5)	13 (59.1)	2 (9.1)	3 (13.6)	3 (13.6)
America, South	2 (20.0)	2 (20.0)	0 (0.0)	2 (20.0)	4 (40.0)
Asia	8 (25.0)	1 (3.1)	7 (21.9)	9 (25.0)	8 (25.0)
Europe	1 (4.2)	12 (50.0)	4 (16.7)	1 (4.2)	6 (25.0)
Oceania	1 (14.3)	3 (42.9)	0 (0.0)	2 (28.6)	1 (14.3)

Note: Percent in Parenthesis.

In about 20 percent of the countries, the civil registration and the vital statistics functions are carried out in the same department or ministry. The advantage of having vital statistics and civil registration in the same ministry or administration is that it makes communication between the two agencies less difficult. This is most important from the standpoint of compilation of national vital statistics where uniformity of data is a prime requisite. It is essential that all the areas in the country use the same basic definitions and registration procedures, identical forms in the collection of data, and the same classifications so that there will be comparability in the statistics produced from records of vital events registered in different parts of the country. Without a close working relationship between the vital statistics and the registration authorities, it will not be possible to produce comparable vital statistics from place to place within the country and from year to year.

The problem of communication and coordination becomes more difficult when the vital statistics and the registration functions are in different ministries or departments. More difficult still are problems in some countries where the civil registration system is decentralized to a subnational level. In these countries, the vital statistics authorities have to deal with a number of autonomous bodies. Much of the success in

these cases will depend on the quality of national leadership and the good will of all concerned.

There are still a few national vital statistics offices without data processing equipment. Also, there are some that are not yet publishing vital statistics or are not current in the issuance of their annual vital statistics. Another problem area is in the production of cause of death statistics in the developing countries where not many deaths are attended by a medical practitioner. In these cases, there are relatively few medical certification of causes of death on which to base cause-of-death statistics.

#### Status of Civil Registration and Vital Statistics

A comprehensive evaluation of the status or the state of development of the civil registration and vital statistics systems will involve the assessment of various aspects of the registration and statistical process such as the adequacy of registration laws and regulations, promptness and completeness of registration, efficiency in providing certification of vital events, quality and completeness of data, efficiency of data processing, adequacy and usefulness of data produced, timeliness in the issuance of data, etc. Of these, perhaps the most useful single index of status is the measure of completeness with which births and deaths are registered.

Periodically, the countries are asked by the United Nations to make an assessment of the registration completeness of births and deaths. These evaluations, (C) for registration completeness of 90 percent or more and (U) for completeness of less than 90 percent, are published in the United Nations Yearbook and in the Population and Vital Statistics Report. In some cases, the evaluations are based on the results of sample surveys. Most of them are "guesstimates". However, in terms of the United Nations standard of completeness, these estimates probably represent a reasonably good assessment of the situation. In some instances, the national authorities may be over-optimistic about the effectiveness of the compulsory provisions of the registration law.

Data on completeness of birth and death registration as reported by the countries are shown in Appendix Table 2 and summarized in Table 4. Of the countries that reported this information, birth registration was considered to be complete in 54 percent of the countries. The corresponding figure for death registration is 51 percent. These percentages are significantly higher than those reported in the previous survey. However, these comparisons do not necessarily mean that there has been an improvement in the registration of vital statistics in the various countries. These differences have arisen mainly from reports from several newly established countries in Europe and Asia for which no previous information was available.

TABLE 4. NUMBER AND PERCENT OF COUNTRIES IN THE REGION REPORTING COMPLETE REGISTRATION OF BIRTHS AND DEATHS

	Birth Registration		Death Registration	
	No.	Percent	No.	Percent
All regions	119	54.3	111	50.7
Africa	10	19.6	7	13.7
America, North	27	81.8	26	78.8
America, South	5	41.7	5	41.7
Asia	22	68.8	19	59.4
Europe	44	95.7	44	95.7
Oceania	11	66.4	10	55.6

Births and deaths are completely registered in almost all the countries in Europe reporting this information. Registration coverage is also relatively good in the various countries in North America which includes the Caribbean countries and Central America. At the other end of the range are the African countries. Except for the island countries, registration coverage is poor in the sub-Saharan countries. Also, there is need for substantial improvement in registration coverage in Asia, South America and Oceania.

#### SUMMARY

This is a report on the organization and status of national civil registration and vital systems based on a questionnaire survey conducted in 1994. The survey shows that the organizational pattern of the national civil registration network varies considerably between countries. In 90 percent of the countries, the system is centralized, that is, the local registration offices are under the technical direction of a central office in the national government. In the 10 percent of the countries where the system is decentralized, there is no national registration office as such and civil registration is a function carried out by the State or provincial government.

There was considerable improvement in the response rate to the present questionnaire survey over that conducted 10 years previous to it. However, there are still a number of countries for which no information is available on the organization of the civil registration and vital statistics systems.

In the countries with a centralized registration system, the Ministry of Interior or Home Affairs is responsible for the registration function in 40 percent of the countries. In 34 percent of the countries, the Ministry of Justice is in charge of registration of vital events. The Health Ministry with its network of health centers is responsible for civil registration in 11 percent of the countries. There is a notable regional pattern in the national organization of the registration systems.

In countries with a centralized registration system, a national office has a direct line of authority over the entire network of registration offices in about 65 percent of the countries. In the remainder of the countries, the local registration offices are manned on a part-time basis by personnel of another ministry. This gives rise to problems in the supervision of

registration activities.

The accessibility of registration offices to the public is determined by the number and location of the local registration offices. Very few countries can afford the luxury of a registration network exclusively for that purpose. The use of existing local government facilities usually results in a less than ideal organizational arrangement for the registration of vital events. One draw back, that is, the dependence on part-time employees of another ministry has already been mentioned. Another problem is the number of local registration offices in the system. This number varies greatly by country and ranges from two or three offices in a small country to almost a quarter of a million in India. The number of local registration offices in the rural areas in most countries is such that, on the average, fewer than one vital event is registered per day. With such a small work load, it is difficult to impress the local registrar of the importance of this activity. It is also difficult to upgrade the position of the local registrar. The problem of establishing a registration network to best serve the public in an efficient manner is an important one and deserves study.

As expected, the central statistical office is charged with the responsibility for compiling national vital statistics in most countries. In more than half of the countries, the central statistical office is located in the Ministry of Finance and Economics and Ministry of Planning. In about 14 percent of the countries, the Ministry of Health is responsible for compiling national vital statistics. In about 11 percent of the countries, the central statistical office is part of the Ministry of Interior where most of the national registration offices are located.

For ease of coordination and operation, it would be desirable to have the national registration and vital statistics agencies located in the same ministry or department. This is usually not the case. In only 20 percent of the countries do we find the civil registration and vital statistics functions being carried out in the same ministry. In countries with a decentralized system of registration, the problem of coordination is more difficult because the national vital statistics office has to deal with registration offices in whatever number of independent federated States.

As of the time of the previous questionnaire survey in 1984, the registration of births and deaths was considered to be complete in about one-half of the countries of the world. The results of this survey show a significant increase in the countries with complete registration. This, however, is an artifact resulting mainly from reports from the newly formed republics in eastern Europe and the former Soviet Union.
