## VITAL STATISTICS REPORT

### *Health Manpower Survey Data*

FROM THE  
NATIONAL CENTER FOR HEALTH STATISTICS

## Preliminary Data From the Survey of Podiatrists: United States, 1974

This report contains highlights of demographic and employment characteristics of persons trained in the field of podiatric medicine who resided in the United States in 1974. This information was obtained during a survey of the Nation's podiatrists, conducted by the National Center for Health Statistics (NCHS), between October and December of 1974. Of the 8,261 podiatrists surveyed, 7,253 (88 percent) completed this survey's questionnaire.

A similar survey of the Nation's podiatrists was conducted by NCHS in 1970. The 1970 survey's mailing list was derived from a compilation of names and addresses of licensed podiatrists obtained from the podiatry licensing board of each State. In preparation for the 1974 survey, graduates of schools of podiatry between 1970 and 1973 were added to this list, and podiatrists known to be deceased or identified as duplicate listings were deleted. Mailing addresses found on this list were verified and updated through address checks performed by the U.S. Postal Service during the summers of 1972, 1973, and 1974.

Of 8,261 persons trained in podiatric medicine who resided in the United States in 1974, 7,120 podiatrists (86 percent) were actively engaged in the provision of podiatric services or in another podiatric activity such as teaching or research and 1,140 persons (14 percent) reported that they were not active in the profession. In 1970, 7,113 podiatrists reported that they were actively engaged in podiatry.<sup>1</sup> Thus, the number of active podiatrists has remained almost constant between 1970 and 1974, while the Nation's resident population increased by 8.2 million persons (4.0 percent).

<sup>1</sup>These totals and all other survey data presented in this report reflect the application of a statistical adjustment designed to compensate for various types of nonresponse to the survey and are believed to represent a good approximation of the actual number of podiatrists at the time of the 1974 and 1970 surveys.

In 1970, there were 3.5 active podiatrists per 100,000 of the Nation's residents.<sup>2,4</sup> By 1974, this proportion decreased slightly to 3.4. Between 1970 and 1973, 1,048 students graduated from the Nation's five schools of podiatry. Thus, it appears that the profession has not kept pace with the 4 percent rate of growth of the Nation's population experienced between 1970 and 1974. However, if the 1974 podiatry graduates (305) are included in this compilation, the ratio of podiatrists per 100,000 population increases to 3.5 podiatrists. The 1974 graduates were not included in the 1974 survey because it was felt that for the most part, they had not yet begun to fully participate in the provision of podiatric services at the time of the survey.

Practitioners of podiatry were located in all States of the Nation. To measure the level of concentration of practitioners per residents within a given geographic area, health statisticians have traditionally relied upon the ratio of practitioners per 100,000 residents within a geographic area. The pitfalls of using this technique are numerous. They include an omission of the following practice characteristics: field of specialty, volume of activity (in terms of hours worked and

50 hours or more-----	954	41	140	185	215	374

<sup>1</sup>Includes office visits and visits in other settings.

<sup>2</sup>Excludes 36 active podiatrists not providing patient care who were not asked to report their principal form of employment.

<sup>3</sup>Includes military, Federal (nonmilitary), State, and local.

<sup>4</sup>Includes prepaid group health plan, other nongovernment organization, and other podiatrist.

patients treated), types of services provided, methods of health care delivery, use of auxiliary personnel, and settings in which patients are treated. Each of these characteristics is available from the information collected during the 1974 Survey of Podiatrists. Data for these characteristics are presented in the tables accompanying this report.

The Northeast Region had the highest concentration of active podiatrists per 100,000 resident population (5.8), while the South had the lowest of these ratios (1.7). As shown in table 1, the two States with the highest concentrations of podiatrists per 100,000 residents were the District of Columbia (7.1) and New York (6.8). The two States having the lowest ratios were Mississippi (0.4) and Alabama (0.5).

There were only 272 females active in podiatry in 1974: of these, 25 percent were 65 years of age or over. In 1970, 317 female podiatrists were identified, 17 percent more than in 1974.

Within recent years, there has been an increased interest in the ethnic composition of the health care team. Equal opportunity in terms of both the delivery and receipt of health care among the various ethnic groups of the population has been the primary motiva-

ting force behind this interest. Two questions which identified Color or race and Whether of Spanish origin or descent were first used for podiatrists during the 1974 survey. Nearly 4 percent of the active podiatrists (262 podiatrists) reported themselves to be other than white. The majority of these podiatrists (85 percent) identified themselves as Negro or black. Eighty-two active podiatrists reported that they were of Spanish origin or descent.<sup>5</sup>

An overwhelming majority of the 7,085 podiatrists providing patient care (81 percent) were in solo practice. Thirteen percent were in partnership with one or more other podiatrists. Of the 950 podiatrists reporting a partnership practice, 731 reported having one podiatrist partner, while 188 reported having two or more podiatrist partners. Two percent of the active podiatrists reported themselves as being in a group-practice arrangement.<sup>6</sup>

<sup>5</sup>This category includes persons reporting themselves as being of Mexican, Puerto Rican, Cuban, Central or South American, or of other Spanish origin or descent.

<sup>6</sup>A group practice was defined as one or more podiatrists conjointly working with at least one person in another health profession who could independently treat patients.

<sup>1</sup>Includes military, Federal (nonmilitary), State, and local.

<sup>2</sup>Includes prepaid group health plan, other nongovernment organization, and other podiatrist.

<sup>3</sup>Number values for these items will not add vertically to yield 7,085 (the total number of podiatrists active in patient care).

The remaining 4 percent of active podiatrists were either salaried by a governmental or a nongovernmental organization, or had some other form of podiatric employment.

Practicing podiatrists did not display a tendency to specialize in terms of a primary clinical activity. General practice was reported as their primary activity by 5,934 podiatrists, 776 podiatrists reported surgery, and 374 reported some other specialty as their primary activity. When asked to report a secondary activity, 971 podiatrists reported none. Of the 6,114 podiatrists who reported a secondary activity, 46 percent reported surgery and 32 percent reported foot orthopedics or biomechanics.

Within recent years, there has been an increased desire on the part of podiatrists to secure hospital and clinic privileges. Of the 7,120 podiatrists who reported that they were active in podiatry, 3,520 podiatrists (49 percent) reported that they did have hospital privileges and 2,400 podiatrists (34 percent) reported that they had clinic privileges.

This advance issuance is intended to disseminate the most important findings of this survey as rapidly as possible. A set of more detailed reports in the *Vital and Health Statistics Series*, Series 14, is currently in preparation. These will present an analytical profile of the podiatry profession, as well as a methodological statement of this survey's techniques. For information regarding issuance of these publications, you may contact:
