

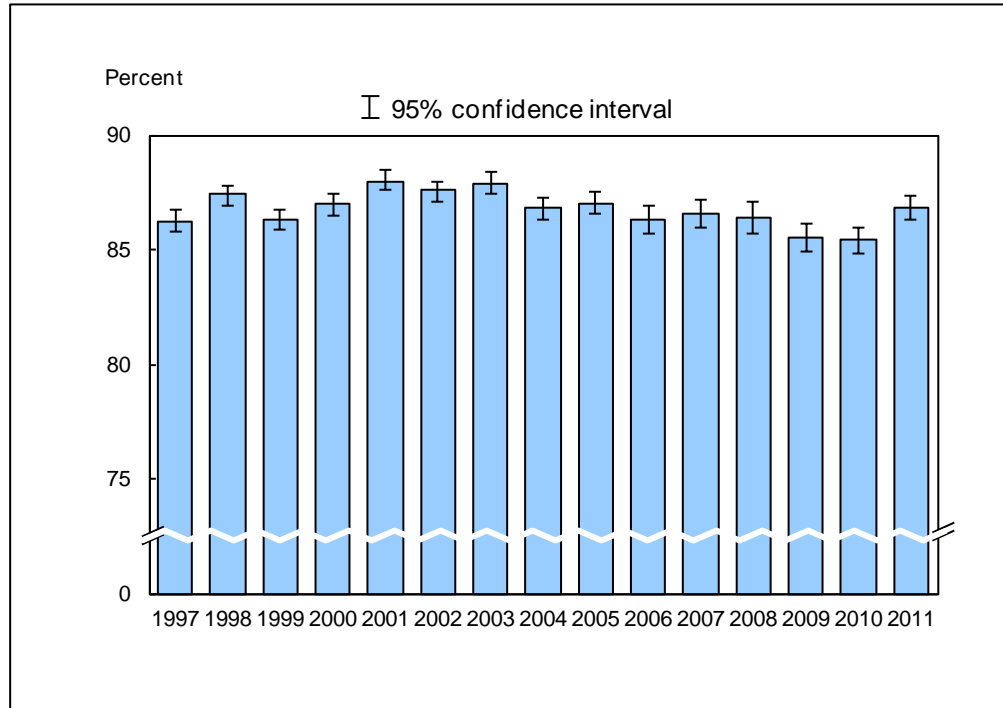

Figure 2.1. Percentage of persons of all ages with a usual place to go for medical care: United States, 1997–2011

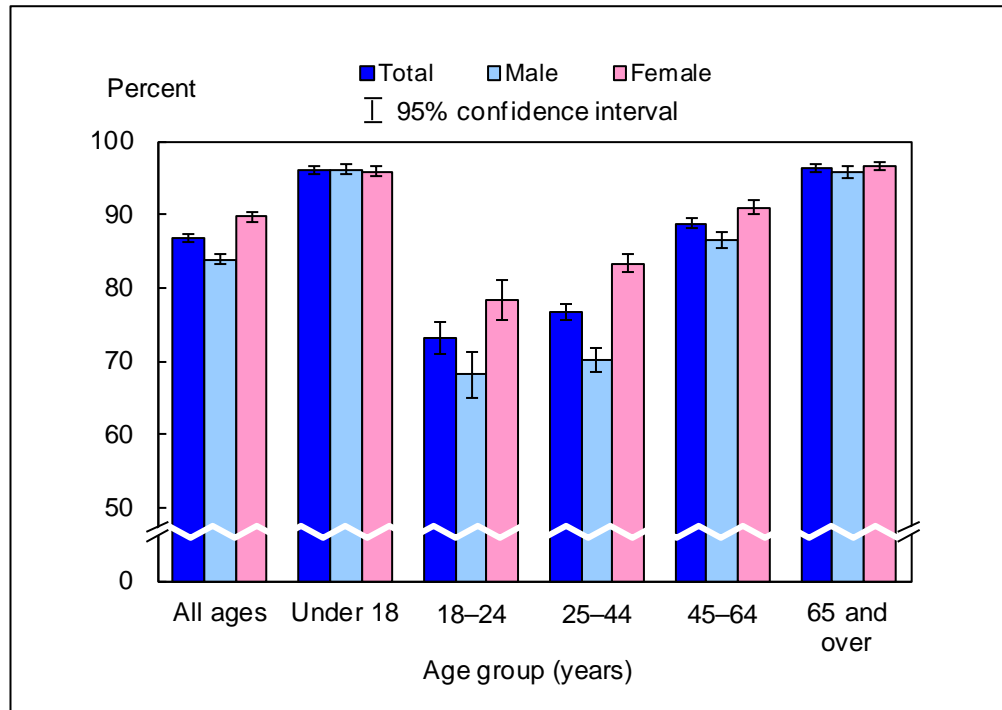

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 1997–2011, combined Sample Adult and Sample Child Core components.

- For 2011, the percentage of persons who had a usual place to go for medical care was 86.8% (95% confidence interval = 86.29%–87.33%), which was higher than the 2010 estimate of 85.4%.
- The percentage of persons of all ages who had a usual place to go for medical care was highest in 2001 (88.0%) and lowest in 2010 (85.4%).

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. • The usual place to go for medical care does not include a hospital emergency room. • The analyses excluded persons with an unknown usual place to go for medical care (about 1.5% of respondents each year). • See "[Technical Notes](#)" for more details.

Figure 2.2. Percentage of persons of all ages with a usual place to go for medical care, by age group and sex: United States, 2011

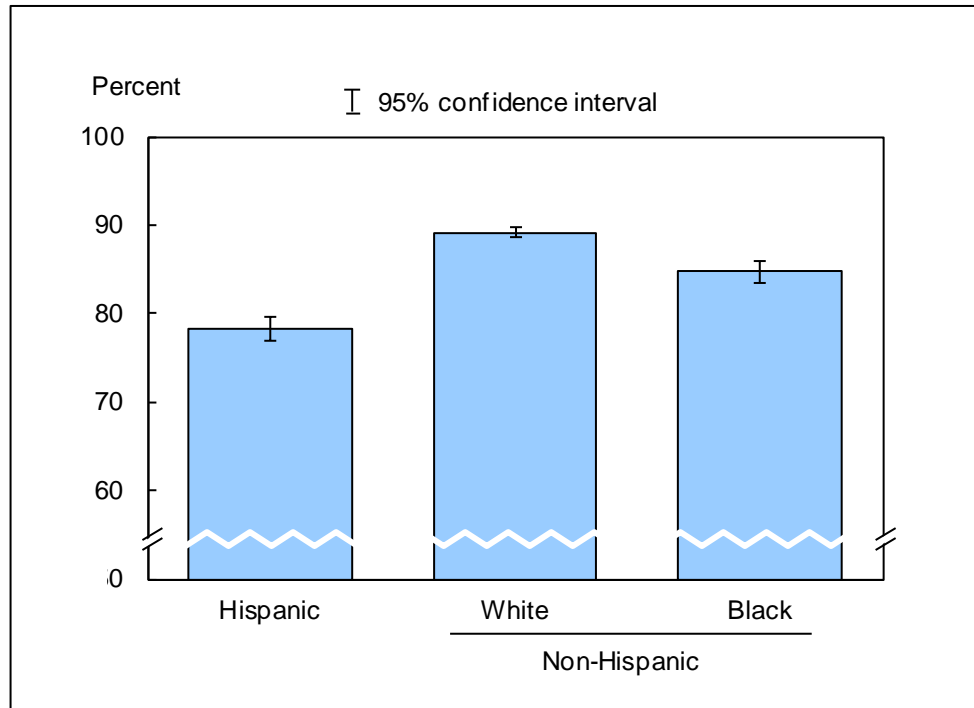

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 2011, combined Sample Adult and Sample Child Core components.

- Persons aged 18–24 were the least likely to have a usual place to go for medical care. Children under age 18 were more likely than adults in age groups 18–24, 25–44, and 45–64 to have a usual place to go for medical care.
- Among those aged 18 and over, the percentage of persons having a usual place to go for medical care increased with age.
- For adults aged 18–24, 25–44, and 45–64, women were more likely than men to have a usual place to go for medical care.

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. • The usual place to go for medical care does not include a hospital emergency room. • The analyses excluded 0.3% of persons with an unknown usual place to go for medical care. • See "[Technical Notes](#)" for more details.

Figure 2.3. Age-sex-adjusted percentage of persons of all ages with a usual place to go for medical care, by race/ethnicity: United States, 2011

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 2011, combined Sample Adult and Sample Child Core components.

- After adjustment for age and sex, the percentage of persons with a usual place to go for medical care was 78.3% for Hispanic persons, 89.1% for non-Hispanic white persons, and 84.8% for non-Hispanic black persons.
- Of the three race/ethnicity groups, Hispanic persons were the least likely to have a usual place to go for medical care, followed by non-Hispanic black persons and non-Hispanic white persons.

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. • The usual place to go for medical care does not include a hospital emergency room. • The analyses excluded 0.3% of persons with an unknown usual place to go for medical care. • Estimates are age-sex-adjusted using the projected 2000 U.S. population as the standard population and using five age groups: under 18, 18–24, 25–44, 45–64, and 65 and over. • See "[Technical Notes](#)" for more details.

¹Crude estimates are presented in the figure.

²Estimates are age adjusted using the projected 2000 U.S. population as the standard population and using five age groups: under 18, 18–24, 25–44, 45–64, and 65 and over.

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Beginning with the 2003 data, the National Health Interview Survey transitioned to weights derived from the 2000 census. In this Early Release, estimates for 2000–2002 were recalculated using weights derived from the 2000 census. See "[Technical Notes](#)" for more details.
