# Anthropometric Reference Data for Children and Adults: United States, 2015-2018 

by Cheryl D. Fryar, M.S.P.H., Margaret D. Carroll, M.S.P.H., Qiuping Gu, M.D., Joseph Afful, M.S., and Cynthia L. Ogden, Ph.D.

## Abstract

## Objective

This report presents anthropometric reference data for the U.S. population in 2015-2018.

## Methods

Body measurements were obtained from 18,061 participants in the 2015-2018 National Health and Nutrition Examination Survey (NHANES). Measurements included weight, height, recumbent length, circumferences, and limb lengths.

## Results

Weighted population means, standard errors of the means, and selected percentiles of body measurement values are reported. Body measurement results are
shown by sex and age, as well as race and Hispanic origin among adults.

## Conclusions

These latest NHANES data show the distribution of weight, height, BMI, circumferences, and lengths, in the U.S. population.

Keywords: anthropometry • body measures • nutrition surveys • National Health and Nutrition Examination Survey

## Introduction

Based on nationally representative anthropometric data, the National Center for Health Statistics (NCHS) has published reference tables on the distribution of various body measurements for the U.S. population (1-5). National Health and Nutrition Examination Survey (NHANES) data are the primary source of body measurement information for the U.S. population. These measurements reflect the mean weight, height, length, and various circumferences of U.S. children and adults. Anthropometry is a measure of nutritional or general health status, dietary adequacy, and growth. This report presents anthropometric reference data from the years 2015-2018 for U.S. children and adults.

## Methods

NHANES is conducted by NCHS and data are collected in household interviews and health examinations in mobile examination centers (MEC). The MECs are staffed by full-time personnel, including health technicians who perform body measurements on survey participants following a standard protocol.

Surveys were conducted on a periodic basis from 1960 to 1994. NHANES became a continuous survey in 1999. Public-use data files are released in 2-year cycles. A combined 4-year data set based on 2015-2016 and 2017-2018 data was used for this report to improve the stability and reliability of the statistical estimates (6-9). The overall examination response rate was $58.7 \%$ during 2015-2016 and 48.8\% during 2017-2018.

## Sample Description

NHANES is a complex, multistage probability sample of the civilian noninstitutionalized U.S. population. The NHANES 2015-2018 sample included participants of all ages. Those aged 80 and over, Hispanic persons, black persons, Asian persons and those with low income were oversampled to improve the precision of the statistical estimates for these groups (9). The analytic sample for this report was based on the 2015-2018 examined sample of 18,061 persons. Pregnant females aged 20-44 were excluded from the tabulations of weight, body mass index (BMI), and circumference measurements. Pregnant females under age 20 are excluded from the tabulations of all body measurements.

The age and race and Hispanic-origin categories presented for adults were based on the survey sample domains (8). Age in adults was categorized into three groups: 20-39, 40-59, and 60 and over. For participants who were under age 20, results were reported by single year of age, except for results for infants under 1 year, which were reported by month of age. Race and Hispanic origin was reported for five groups: non-Hispanic white, non-Hispanic black, non-Hispanic Asian, all Hispanic, and Mexican-American persons.

## Body Measures

The NHANES Anthropometry Procedures Manual describes the protocol, equipment, quality control, and measurement procedures in detail (10). All NHANES participants were eligible for the anthropometry examination component. Specific measurements were conducted depending on the age of the participants.

Weight was measured on all participants to the nearest 0.1 kilogram using a digital floor scale. Head circumference was measured on infants from birth to 6 months of age to the nearest 0.1 centimeter using a plastic head circumference measurement tape. Recumbent length was measured from birth through 47 months of age to the nearest 0.1 centimeter using a digital infantometer.
Upperarm length and arm circumference was measured on participants starting at 2 months of age. Upper arm length was measured with a tape measure from the posterior border of the acromion process to the tip of the olecranon process; during the measurement, the upper arm length midpoint was marked. The midupper arm circumference was measured with a tape measure at the marked point.

Standing height or stature and waist circumference were measured to the nearest 0.1 centimeters on participants starting at age 2 years. Standing height was measured with a wall-mounted stadiometer. Waist circumference was measured with a tape measure at the uppermost lateral border of the hip crest (ilium).
In addition to the measurements above, upper leg length measurements were taken on participants aged 8 and over. Upper leg measurements were taken on seated participants; the distance from the inguinal crease to the distal end of the femur was measured.

Weight, recumbent length, and standing height values were recorded automatically. The other body measurement data were recorded using computerassisted data entry. All results were based on a single body measurement examination.

One index is reported, body mass index BMI, which was calculated as weight in kilograms, divided by height in meters squared $\left(\mathrm{kg} / \mathrm{m}^{2}\right)$.

## Statistical Analysis

Unweighted sample sizes and weighted means, standard errors, and select percentiles were estimated. Data were weighted using examination sample weights to produce national estimates. The NHANES examination sample weights incorporate the differential probabilities of selection and include adjustments for oversampling of selected populations, noncoverage, and nonresponse. Standard errors were estimated using SUDAAN by Taylor series linearization because of the complex sample design (11).
The reliability of the estimates produced for this report was evaluated. Estimates of means and percentiles based on less than 8 degrees of freedom or with a relative standard error (RSE) greater than $30 \%$ were considered statistically unreliable. Although NCHS now uses new criteria for presentation of proportions (12), similar criteria for means and percentiles have not been established. In Tables 1-29, estimates based on less than 8 degrees of freedom are identified with an asterisk (*). No estimates in this report had RSEs greater than 30\%. Estimates with standard errors that could not be calculated using SUDAAN because of small cell sizes were omitted from the tables and are identified with a dagger ( $\dagger$ ).

## Results

A list of detailed tables based on the various body measurements and BMI is found in the Table on the following page. Tables 1-29 contain the sample size, mean, standard error, and select percentiles for the different measures. Results are reported by sex and age group, and the results for adults aged 20 and over are also presented by race and Hispanic origin. For example, during 2015-2018, the average man weighed around 200 pounds (Table 6) and was 5 feet and 9 inches (Table 12), while, the average woman weighed about 171 pounds (Table 4) and was 5 feet and 3.5 inches (Table 10). Results from previous surveys for most measurements have been reported for the National Health Examination Survey and NHANES conducted from 1960-2014 (1-5,13-23). A historical summary of published body measurement reference data is available in the Appendix of this report.

Table. Detailed tables with body measurements or indices from the National Health and Nutrition Examination Survey, 2015-2018

| Table number | Measurement or index (unit of measurement) | Age group and sex |
| :---: | :---: | :---: |
| 1 | Weight (kilograms) | Birth-19 years |
| 2 | Weight (pounds) | Birth-19 years |
| 3 | Weight (kilograms) | Adult females 20 and older |
| 4 | Weight (pounds) | Adult females 20 and older |
| 5 | Weight (kilograms) | Adult males 20 and older |
| 6 | Weight (pounds) | Adult males 20 and older |
| 7 | Standing height (centimeters) | Persons 2-19 years |
| 8 | Standing height (inches) | Persons 2-19 years |
| 9 | Standing height (centimeters) | Adult females 20 and older |
| 10 | Standing height (inches) | Adult females 20 and older |
| 11 | Standing height (centimeters) | Adult males 20 and older |
| 12 | Standing height (inches) | Adult males 20 and older |
| 13 | Body mass index | Persons 2-19 years |
| 14 | Body mass index | Adult females 20 and older |
| 15 | Body mass index | Adult males 20 and older |
| 16 | Head circumference (centimeters) | Birth through 6 months |
| 17 | Recumbent length (centimeters) | Birth through 47 months |
| 18 | Waist circumference (centimeters) | Persons 2-19 years |
| 19 | Waist circumference (centimeters) | Adult females 20 and older |
| 20 | Waist circumference (centimeters) | Adult males 20 and older |
| 21 | Mid-upper arm circumference (centimeters) | Persons 2 months-19 years |
| 22 | Mid-upper arm circumference (centimeters) | Adult females 20 and older |
| 23 | Mid-upper arm circumference (centimeters) | Adult males 20 and older |
| 24 | Upper arm length (centimeters) | Persons 2 months-19 years |
| 25 | Upper arm length (centimeters) | Adult females 20 and older |
| 26 | Upper arm length (centimeters) | Adult males 20 and older |
| 27 | Upper leg length (centimeters) | Persons 8-19 years |
| 28 | Upper leg length (centimeters) | Adult females 20 and older |
| 29 | Upper leg length (centimeters) | Adult males 20 and older |

SOURCE: National Center for Health Statistics, National Health and Nutrition Examination Survey.

## Discussion

This report provides the most recent anthropometric reference data for U.S. children and adults. Previous publications $(23,24)$ have investigated trends over time, including one that showed that between 1999 and 2016, mean weight, waist circumference, and BMI in adults increased, while mean height did not change in many demographic subgroups (23). NHANES anthropometry data have been used in making decisions regarding health policy and programs (25-28), as well as regulatory decisions. For example, the increasing mid-upper arm circumferences found in children and adults have been used to formulate guidelines for health practitioners regarding the selection of blood pressure cuff sizes for blood pressure measurement $(26,27)$. The Federal Aviation Administration used NHANES body measurement data in the determination of average passenger weights in its Advisory Circular on Aircraft Weight and Balance Control (29). Similarly, the U.S. Coast Guard looked at NHANES body weight data when considering passenger weight and vessel stability requirements (30). NHANES will continue to provide national reference values for weight, height, waist circumference, and other anthropometric measures of U.S. children, adolescents, and adults.

# Vital and Health Statistics Series Descriptions 

## Active Series

Series 1. Programs and Collection Procedures
Reports describe the programs and data systems of the National Center for Health Statistics, and the data collection and survey methods used. Series 1 reports also include definitions, survey design, estimation, and other material necessary for understanding and analyzing the data.
Series 2. Data Evaluation and Methods Research
Reports present new statistical methodology including experimental tests of new survey methods, studies of vital and health statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. Reports also include comparison of U.S. methodology with those of other countries.

Series 3. Analytical and Epidemiological Studies
Reports present data analyses, epidemiological studies, and descriptive statistics based on national surveys and data systems. As of 2015, Series 3 includes reports that would have previously been published in Series 5, 10-15, and 20-23.

## Discontinued Series

Series 4. Documents and Committee Reports
Reports contain findings of major committees concerned with vital and health statistics and documents. The last Series 4 report was published in 2002; these are now included in Series 2 or another appropriate series.

Series 5. International Vital and Health Statistics Reports Reports present analytical and descriptive comparisons of U.S. vital and health statistics with those of other countries. The last Series 5 report was published in 2003; these are now included in Series 3 or another appropriate series.
Series 6. Cognition and Survey Measurement
Reports use methods of cognitive science to design, evaluate, and test survey instruments. The last Series 6 report was published in 1999; these are now included in Series 2.
Series 10. Data From the National Health Interview Survey
Reports present statistics on illness; accidental injuries; disability; use of hospital, medical, dental, and other services; and other health-related topics. As of 2015, these are included in Series 3.

Series 11. Data From the National Health Examination Survey, the National Health and Nutrition Examination Surveys, and the Hispanic Health and Nutrition Examination Survey Reports present 1) estimates of the medically defined prevalence of specific diseases in the United States and the distribution of the population with respect to physical, physiological, and psychological characteristics and 2) analysis of relationships among the various measurements. As of 2015, these are included in Series 3.

Series 12. Data From the Institutionalized Population Surveys
The last Series 12 report was published in 1974; these reports were included in Series 13, and as of 2015 are in Series 3.

Series 13. Data From the National Health Care Survey
Reports present statistics on health resources and use of health care resources based on data collected from health care providers and provider records. As of 2015, these reports are included in Series 3.

Series 14. Data on Health Resources: Manpower and Facilities
The last Series 14 report was published in 1989; these reports were included in Series 13, and are now included in Series 3.

Series 15. Data From Special Surveys
Reports contain statistics on health and health-related topics from surveys that are not a part of the continuing data systems of the National Center for Health Statistics. The last Series 15 report was published in 2002; these reports are now included in Series 3.

Series 16. Compilations of Advance Data From Vital and Health Statistics
The last Series 16 report was published in 1996. All reports are available online; compilations are no longer needed.
Series 20. Data on Mortality
Reports include analyses by cause of death and demographic variables, and geographic and trend analyses. The last Series 20 report was published in 2007; these reports are now included in Series 3.

Series 21. Data on Natality, Marriage, and Divorce
Reports include analyses by health and demographic variables, and geographic and trend analyses. The last Series 21 report was published in 2006; these reports are now included in Series 3.

Series 22. Data From the National Mortality and Natality Surveys
The last Series 22 report was published in 1973. Reports from sample surveys of vital records were included in Series 20 or 21, and are now included in Series 3.
Series 23. Data From the National Survey of Family Growth
Reports contain statistics on factors that affect birth rates, factors affecting the formation and dissolution of families, and behavior related to the risk of HIV and other sexually transmitted diseases. The last Series 23 report was published in 2011; these reports are now included in Series 3.
Series 24. Compilations of Data on Natality, Mortality, Marriage, and Divorce
The last Series 24 report was published in 1996. All reports are available online; compilations are no longer needed.
