VITAL and HEALTH STATISTICS

DATA FROM THE NATIONAL HEALTH SURVEY

Current Estimates

From the Health Interview Survey

United States-July 1965 - June 1966

Provisional estimates of incidence of acute conditions, number of persons reporting one or more chronic conditions, number of persons injured, hospital discharges, disability days, and number of persons with corrective lenses. Based on data collected in household interviews during the period July 1965-June 1966.

COOPERATION OF THE BUREAU OF THE CENSUS

Under the legislation establishing the National Health Survey, the Public Health Service is authorized to use, insofar as possible, the services or facilities of other Federal, State, or private agencies.

In accordance with specifications established by the National Health Survey, the Bureau of the Census, under a contractual arrangement, participates in most aspects of survey planning, selects the sample, collects the data, and carries out certain parts of the statistical processing.

Appendix III. Questionnaire	39

IN THIS REPORT provisional statistics are presented, based on data collected in household interviews for the Health Interview Survey during July 1965-June 1966, on the incidence of acute illnesses and injuries and associated disability days; the percent of the civilian, noninstitutional population with one or more chronic conditions; the number of persons injured and associated disability days; the number of hospital discharges; the number of disability days associated with illness; and the number of persons with corrective lenses.

This report is the fourth in a series of annual publications providing provisional estimates from the Health Interview Survey based on consolidation of quarterly data. Due to the provisional nature of these estimates, they may, in some instances, differ slightly from revised data released at a later date.

CURRENT ESTIMATES

FROM THE HEALTH INTERVIEW SURVEY

Mary Lou Bauer, Division of Health Interview Statistics

HIGHLIGHTS FOR THE PERIOD

Acute Conditions

From July 1965 through June 1966, an estimated 404.4 million acute illnesses and injuries required restriction of usual activity or medical attention among the civilian, noninstitutional population of the United States (tables 1 and 4). This estimated incidence represents an average of 212.0 acute conditions per 100 persons per year, which is about the same as the incidence rate of 212.7 conditions in the preceding year.

Despite this stability in the overall rate, the incidence of specific conditions did change. The major variation was an 8.2 percent increase in the number of respiratory conditions per 100 persons, reflecting primarily the higher incidence of illnesses reported as influenza. The incidence of influenza (without digestive manifestations) was 39.3 per 100 persons for the 12-month period ending June 1966, a substantial increase from the preceding year's rate of 30.7 per 100 persons. As shown in figure 1, the incidence of respiratory conditions was higher throughout the 12-month period, with peak incidence, as usual, in the January-March quarter. From December 1965 through May 1966, influenza (type A and/or B) was identified in 49 of the 50 States and it was reported to be widespread in half of them from February to April.¹

Other notable changes in the incidence of acute conditions were the continued decline in the inci-

dence of infective and parasitic diseases and a decrease in the incidence of injuries from a rate of 29.9 injuries per 100 persons to that of 25.4 for the current year. The drop in reporting of injuries has not been explained despite extensive investigation of the data and their processing. There were no significant processing errors that would explain the differences. Even though there was a substantial change in the format of the questionnaire used for the collection of data during the period July 1965-June 1966, it was not felt that the format change would be wholly responsible for the discrepancy. The data on injuries are therefore published as the Health Interview Survey's best estimates at the present time.

Acute illness and injury caused an average of 8.2 days of restricted activity per person, including 3.7 days in bed (tables 2, 3, 5, and 6). In addition, acute conditions were responsible for 4.6 days lost from school per child 6 to 16 years of age (table 7), and 3.7 days lost from work for each currently employed person (table 8). On all of these measures of disability, females had higher rates than males.

Persons With Chronic Conditions

An estimated 93.7 million persons in the civilian, noninstitutional population reported one or more chronic diseases or impairments (table 9). These persons constitute 49.1 percent of the population, contrasted with 46.3 percent who reported chronic conditions for the preceding year. The increase occurred in all age groups and for both sexes, but the change was greater among males than females. Females continued to have a higher proportion of persons with chronic con-

¹Communicable Disease Center: *Influenza-Respiratory Disease Surveillance*. Report No. 82. Public Health Service. Atlanta, Ga., June 30, 1966.

ditions than did males at all ages except under 17 years. For both sexes the percentage of persons with one or more chronic conditions increased with age, reaching a maximum at 65 years and older of 86.5 percent for females and 83.5 percent for males.

Persons Injured

Approximately 45.1 million persons, or a rate of 23.7 persons injured per 100 population, reported injuries during the period July 1965 through June 1966 (table 10). This rate was appreciably lower than the rates of the past 2 years which were, respectively, 28.8 and 28.6 per 100 persons. During the current year about 53.3 percent of the injured persons restricted their activities for 1 or more days. About 39.4 percent of the persons injured had both medical attention and days of restricted activity; another 46.7 percent were only medically attended with no restriction of activity. Approximately 22.3 percent spent 1 or more days in bed as a result of injury.

The persons injured may be classified in one or more of four classes of accidents: moving motor vehicle, while at work, home, and other. The accident is classified as "other" if the occurrence of injury cannot be classified in one or more of the first three classes of accident; it would include, for example, accidents occurring in public places, such as department stores or public sidewalks or playgrounds, and accidents occurring at school.

The four classes of accidents were differentially affected by the overall decline in reported injuries. Rates of home and other injuries showed the greatest decreases, while the rates for injuries from moving motor vehicles and at work actually increased slightly.

For males, the rates of restricted activity resulting from injuries increased for all classes of accidents (table 11). The increases in restricted activity for injuries at work and from moving motor vehicles were quite substantial. Females showed no change in rates for these two classes of accidents, but they had much lower rates of restricted activity associated with home and other accidents.

Increases in bed disability from injuries were considerably smaller than the changes in restricted activity and were confined to injuries at work and moving motor vehicle accidents (table 12). However, both sexes were affected. The increased rates of both restricted activity and bed disability occurred primarily among the working population from 17 through 64 years of age.

By class of accident the percent of persons with short-term disability was as follows:

	Activity- restricting	Bed- disabling
Moving motor vehicle	71.8	44.0
While at work	50.1	20.3
Home	49.9	17.8
Other	55.4	23.9

Only two of the above figures represent sizable changes from the preceding year's estimates; restricted activity from moving motor vehicles is considerably higher and restricted activity from "other" accidents much lower.

Hospital Discharges and Length of Stay

The estimated number of discharges from short-stay hospitals for hospitalizations of one or more nights was 24.2 million, representing an average of 12.7 discharges per 100 persons for the period July 1965-June 1966 (table 13). The rates by age and sex were essentially the same as those of the preceding year. These data are derived from health interviews. They will differ from those published in the report on hospital discharges (Series 10, No. 30) since they exclude hospitalization of decedents. They will differ also from data reported by the Hospital Discharge Survey because of differences in population covered and types of hospitals included.

The average length of stay per discharge was 8.1 days. The average stay for males was about one-third longer than that for females: 9.6 days contrasted with 7.1. Males stayed longer than females at all ages except under 17 years.

Disability Days

Disability days for the period ending June 1966 remained at about the same level as they had been the preceding year. From all illnesses and injuries, the population averaged 15.6 days of restricted activity per person per year, including 6.3 days in bed (table 14). The currently employed population experienced 5.8 work-loss days per person, and children aged 6 to 16 averaged 5.2 days lost from school (table 15).

Corrective Lenses

About 48.1 percent of the total population 3 years of age and older had corrective lenses (eyeglasses, contact lenses, or both). Almost all of the persons reporting corrective lenses had eyeglasses. A very small proportion (1.0 percent) had contact lenses either as their only visual aid or in addition to eyeglasses (table 16).

In each age category the prevalence of corrective lenses was higher among females than males. The least differential occurred in the 3-16-year age group. The majority of both sexes 45 years and over had corrective lenses: 84.0 percent of the males and 91.5 percent of the females.

Seasonal Variation

Tables 18-20 and figures 1-3 present quarterly trends of three health topics: acute conditions, persons injured, and person-disability days.

SOURCE AND LIMITATIONS OF DATA

The information contained in this publication is derived from household interviews conducted by the Health Interview Survey in cooperation with the U.S. Bureau of the Census in a probability sample of the civilian, noninstitutional population of the United States. The sample is designed so that interviews are conducted during every week of the year. During the 52-week period from July 1965 through June 1966, the sample was composed of approximately 42,000 households containing about 134,000 persons living at the time of the interview.

A description of the design of the survey, the methods used in estimation, and general qualifications of the data obtained from surveys is presented in Appendix I. Since the estimates shown in this report are based on a sample of the population rather than on the entire population, they are subject to sampling error. Therefore, particular attention should be paid to the section entitled "Reliability of Estimates." Sampling errors for most of the estimates are of relatively low magnitude. However, where an estimated number or the numerator or denominator of a rate or percentage is small, the sampling error may be high. Charts of relative sampling errors and instructions for their use are shown in Appendix I.

Certain terms used in this report are defined in Appendix II. Some of the terms have specialized meanings for the purpose of the survey. For example, estimates of the incidence of acute conditions include, with certain exceptions, those conditions which had started within 2 weeks and which involved either medical attention or restricted activity. The exceptions, which are listed in Appendix II, are certain conditions such as heart trouble and diabetes which are always considered to be chronic, regardless of duration or onset.

Estimates of the number of disability days associated with acute conditions are derived from the number of days of disability experienced during the 2-week period prior to the week of interview and include all such days reported, even if the acute condition causing the disability had its onset prior to the 2-week period. Disability days associated with acute conditions are recorded on a condition basis. If an individual has more than one acute condition on the same day, the count of disability days will exceed the actual number of days disabled, i.e., person days of disability.

The questionnaire used during the 12 months of data collection is illustrated in Appendix III. Information about acute conditions, persons with one or more chronic conditions, persons injured, and disability days was derived from the responses to the illness-recall questions (questions 6-12 on the worksheet) and the condition pages. Information about hospital discharges was obtained from the hospital page, and data on corrective lenses from the eyeglass page.

Annual estimates shown were obtained by consolidating data tabulated on a quarterly basis and, due to rounding of numbers, may, in some instances, differ slightly from those prepared from annual tabulations to be released at a later date. In order to release provisional data quickly, it has been necessary to limit the amount of demographic information.

APPENDIX I

TECHNICAL NOTES ON METHODS

Background of This Report

This report is one of a series of statistical reports prepared by the National Health Survey. It is based on information collected in a continuing nationwide sample of households in the Health Interview Survey, a major part of the program.

The Health Interview Survey utilizes a questionnaire which, in addition to personal and demographic characteristics, obtains information on illnesses, injuries, chronic conditions and impairments, and other health topics. As data relating to each of these various broad topics are tabulated and analyzed, separate reports are issued which cover one or more of the specific topics. The present report is based on the consolidated sample for 52 weeks of interviewing ending June 1966.

The population covered by the sample for the Health Interview Survey is the civilian, noninstitutional population of the United States living at the time of the interview. The sample does not include members of the Armed Forces, U.S. nationals living in foreign countries, or crews of vessels. It should also be noted that the estimates shown do not represent a complete inventory of injuries for the specified calendar period since no adjustment has been made for persons who incurred injuries during the 2-week-recall period but who died prior to the interview.

Statistical Design of the Health Interview Survey

General plan.—The sampling plan of the survey follows a multistage probability design which permits a continuous sampling of the civilian population of the United States. The first stage of this design consists of drawing a sample of 357 from about 1,900 geographically defined primary sampling units (PSU's) into which the United States has been divided. A PSU is a county, a group of contiguous counties, or a standard metropolitan statistical area.

With no loss in general understanding, the remaining stages can be combined and treated in this discussion as an ultimate stage. Within PSU's, then, ultimate stage units called segments are defined in such a manner that each segment contains an expected nine households. A segment consists of a cluster of neighboring households or addresses. Two general types of segments are used: (1) area segments which are defined geographically, and (2) B segments which are defined from a list of addresses from the Decennial Census and Survey of Construction. Each week a random sample of about 90 segments is drawn. In the approximately 800 households in these segments, household members are interviewed concerning factors related to health.

Since the household members interviewed each week are a representative sample of the population, samples for successive weeks can be combined into larger samples. Thus the design permits both continuous measurement of characteristics of high incidence or prevalence in the population and, through the larger consolidated samples, more detailed analysis of less common characteristics and smaller categories. The continuous collection has administrative and operational advantages as well as technical assets since it permits field work to be handled with an experienced, stable staff.

Sample size and geographic detail.—The national sample plan for the 12-month period ending in June included about 134,000 persons from 42,000 households in about 4,700 segments.

The overall sample was designed in such a fashion that tabulations can be provided for each of the major geographic regions and for urban and rural sectors of the United States.

Collection of data.—Field operations for the household survey are performed by the Bureau of the Census under specifications established by the National Center for Health Statistics. In accordance with these specifications the Bureau of the Census selects the sample, conducts the field interviewing as an agent of the Center, and performs a manual editing and coding of the questionnaires. The Health Interview Survey, using Center electronic computers, carries out further editing and tabulates the edited data.

Estimating methods.—Each statistic produced by the survey—for example, the number of bed-disability days occurring in a specified period—is the result of two stages of ratio estimation. In the first of these, the control factor is the ratio of the 1960 decennial population count to the 1960 estimated population in the National Health Survey's first-stage sample of PSU's. These factors are applied for some 25 color-residence classes. Later, ratios of sample-produced estimates of the population to official Bureau of the Census figures for current population in about 60 age-sex-color classes are computed and serve as second-stage factors for ratio estimating.

The effect of the ratio-estimating process is to make the sample more closely representative of the population by age, sex, color, and residence, thus reducing sampling variance.

As noted, each week's sample represents the population living during that week and characteristics of this population. Consolidation of samples over a time period, say a calendar quarter, produces estimates of average characteristics of the U.S. population for that calendar quarter. Similarly, population data for a year are averages of the four quarterly figures.

For statistics measuring the number of occurrences during a specified time period, such as the incidence of acute conditions, a similar computational procedure is used, but the statistics are interpreted differently. For these items, the questionnaire asks for the respondent's experience over the 2 calendar weeks prior to the week of interview. In such instances the estimated quarterly total for the statistic is simply 6.5 times the average 2-week estimate produced by the 13 successive samples taken during the period. The annual total is the sum of the four quarters. Thus, the experience of persons interviewed during a year-experience which actually occurred for each person in a 2-calendar-week interval prior to week of interview-is treated as though it measured the total of such experience during the year. Such interpretation leads to no significant bias.

General Qualifications

Nonresponse.—Data were adjusted for nonresponse by a procedure which imputes to persons in a household which was not interviewed the characteristics of persons in households in the same segment which were interviewed. The total noninterview rate was 5 percent— 1 percent was refusal, and the remainder was primarily due to the failure to find any eligible household respondent after repeated trials.

The interview process.—The statistics presented in this report are based on replies secured in interviews of persons in the sampled households. Each person 19 years of age and over, available at the time of interview, was interviewed individually. Proxy respondents within the household were employed for children and for adults not available at the time of the interview, provided the respondent was closely related to the person about whom information was being obtained.

There are limitations to the accuracy of diagnostic and other information collected in household interviews. For diagnostic information, the household respondent can, at best, pass on to the interviewer only the information the physician has given the family. For conditions not medically attended, diagnostic information is often no more than a description of symptoms. However, other facts, such as the number of disability days caused by the condition, can be obtained more accurately from household members than from any other source since only the persons concerned are in a position to report this information.

Rounding of numbers.—The original tabulations on which the data in this report are based show all estimates to the nearest whole unit. All consolidations were made from the original tabulations using the estimates to the nearest unit. In the final published tables the figures are rounded to the nearest thousand, although these are not necessarily accurate to that detail. Devised statistics, such as rates and percent distributions, are computed after the estimates on which these are based have been rounded to the nearest thousand.

Population figures.—Some of the published tables include population figures for specified categories. Except for certain overall totals by age and sex, which are adjusted to independent estimates, these figures are based on the sample of households in the National Health Survey. These are given primarily to provide denominators for rate computation and for this purpose are more appropriate for use with the accompanying measures of health characteristics than other population data that may be available. In some instances these will permit users to recombine published data into classes more suitable to their specific needs. With the exception of the overall totals by age and sex mentioned above, the population figures differ from corresponding figures (which are derived from different sources) published in reports of the Bureau of the Census. For population data for general use, see the official estimates presented in Bureau of the Census reports in the P-20, P-25, and P-60 series.

Reliability of Estimates

Since the estimates are based on a sample, they will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and interviewing personnel and procedures. As in any survey, the results are also subject to measurement error.

The standard error is primarily a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. As calculated for this report, the standard error also reflects part of the variation which arises in the measurement process. It does not include estimates of any biases which might lie in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error and about 99 out of 100 that it would be less than 2½ times as large.

The relative standard error of an estimate is obtained by dividing the standard error of the estimate by the estimate itself and is expressed as a percentage of the estimate. Included in this Appendix are charts from which the relative standard errors can be determined for estimates shown in the report. In order to derive relative errors which would be applicable to a wide variety of health statistics and which could be prepared at a moderate cost, a number of approximations were required. As a result, the charts provide an estimate of the approximate relative standard error rather than the precise error for any specific aggregate or percentage.

Three classes of statistics for the health survey are identified for purposes of estimating variances.

Narrow range.— This class consists of (1) statistics which estimate a population attribute, e.g., the number of persons in a particular income group, and (2)statistics for which the measure for a single individual for the period of reference is usually either 0 or 1, on occasion may take on the value 2, and very rately 3.

Medium range.—This class consists of other statistics for which the measure for a single individual for the period of reference will rarely lie outside the range 0 to 5.

Wide range.— This class consists of statistics for which the measure for a single individual for the period of reference frequently will range from 0 to a number in excess of 5, e.g., the number of days of bed disability experienced during the year.

In addition to classifying variables according to whether they are narrow-, medium-, or wide-range, statistics in the survey are further defined as:

- Type A.— Statistics on prevalence and incidence data for which the period of reference in the questionnaire is 12 months.
- Type B.- Incidence-type statistics for which the period of reference in the questionnaire is 2 weeks.
- Type C.-Statistics for which the reference period is 6 months.

Only the charts on sampling error applicable to data contained in this report are presented.

General rules for determining relative sampling errors.—The "guide" on page 27, together with the following rules, will enable the reader to determine approximate relative standard errors from the charts for estimates presented in this report.

- Rule 1. Estimates of aggregates: Approximate relative standard errors for estimates of aggregates such as the number of persons with a given characteristic are obtained from appropriate curves on pages 28-31. The number of persons in the total U.S. population or in an age-sex class of the total population is adjusted to official Bureau of the Census figures and is not subject to sampling error.
- Rule 2. Estimates of percentages in a percent distribution: Relative standard errors for percentages in a percent distribution of a total are obtained from appropriate curves on page 32. For values which do not fall on one of the curves presented in the chart, visual interpolation will provide a satisfactory approximation.
- Rule 3. Estimates of rates where the numerator is a subclass of the denominator: (Not required for statistics presented in this report.)
- Rule 4. Estimates of rates where the numerator is not a subclass of the denominator: This rule applies where a unit of the numerator often occurs more than once for any one unit in the denominator. For example, in the computation of the number of persons injured per 100 currently employed persons per year, it is possible that a person in the denominator could have sustained more than one of the injuries included in the numerator. Approximate relative standard errors for rates of this kind may be computed as follows:
 - (a) Where the denominator is the total U.S. population or includes all persons in one or more of the age-sex groups of the total population, the relative error of the rate is equivalent to the relative error of the numerator which can be obtained directly from the appropriate chart.
 - (b) In other cases, obtain the relative standard error of the numerator and of the denominator from the appropriate curve. Square each of these relative errors, add the resulting values, and extract the square root of the sum. This procedure will result in an upper bound and often will overstate the error.

The code shown below identifies the appropriate curve to be used in estimating the relative standard error of the statistic described. The four components of each code describe the statistic as follows: (1)

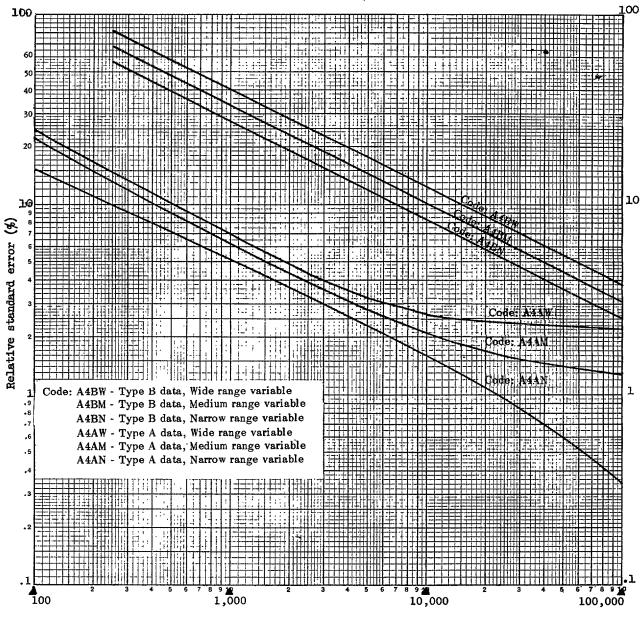

.

A=aggregate, P=percentage; (2) the number of calendar quarters of data collection; (3) the type of the statistic as described on page 26; and (4) the range of the statistic as described on page 26.

Statistic	Use:								
Statistic	Rule	Code o	n page						
Number of Persons in the U.S. population, or total number in any age-sex category Persons in any other population group	Not subjec 1	t to sampling error A4AN	28

Disability days: Per quarter Per year	4(a) 4(a)	A1BW A4BW	31 28						
Percentage distribution of: Persons with 1+ chronic conditions	2	P4AN-M	32						

,

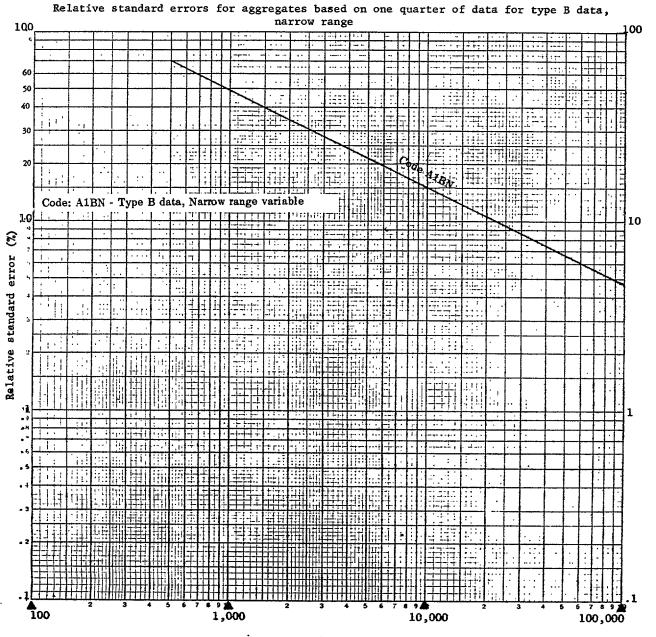

Relative standard errors for aggregates based on four quarters of data collection for data of all types and ranges

Size of estimate (in thousands)

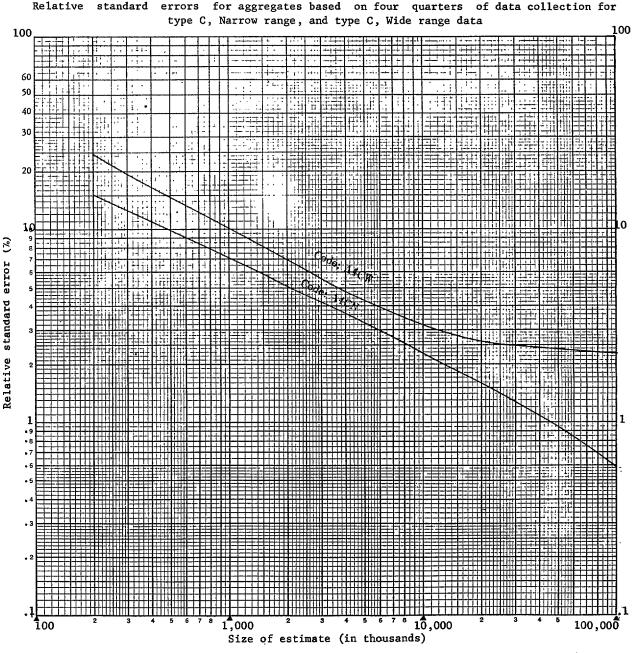

Example of use of chart: An aggregate of 2,000,000 (on scale at bottom of chart) for a Narrow range Type A statistic (code: A4AN) has a relative standard error of 3.6 percent, (read from scale at left side of chart), or a standard error of 72,000 (3.6 percent of 2,000,000). For a Wide range Type B statistic (code: A4BW), an aggregate of 6,000,000 has a relative error of 16.0 percent or a standard error of 960,000 (16 percent of 6,000,000).

28

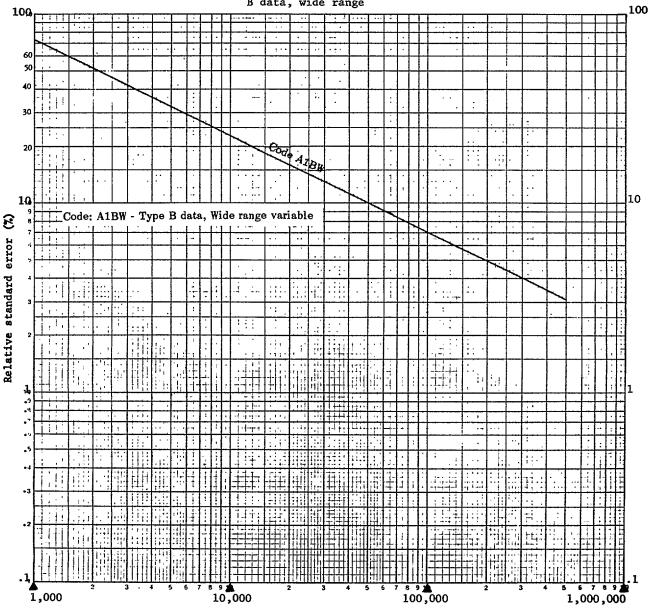

Size of estimate (in thousands)

Example of use of chart: An aggregate of 6,000,000 (on scale at bottom of chart) for a Narrow range Type B statistic has a relative standard error of 19.3 percent, read from scale at left side of chart, or a standard error of 1,158,000 (19.3 percent of 6,000,000).

Example of use of chart: An aggregate of 1,000,000 (on scale at bottom of chart) for a Narrow range type C statistic (code: A4CN) has a relative standard error of 7.1 percent, read from scale at left side of chart, or a standard error of 71,000 (7.1 percent of 1,000,000).

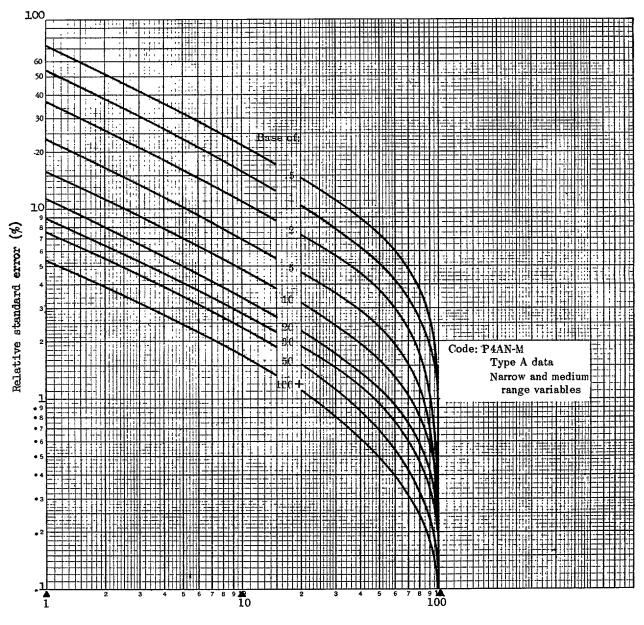

Relative standard errors for aggregates based on one quarter of data collection for type B data, wide range

Size of estimate (in thousands)

Example of use of chart: An aggregate of 20,000,000 (on scale at bottom of chart) for a wide range type B statistic has a relative standard error of 16.0 percent, read from scale at left side of chart, or a standard error of 3,200,000 (16.0 percent of 20,000,000).

Relative standard errors for percentages based on four quarters of data collection for type A data, Narrow and Medium range

(Base of percentage shown on curves in millions)

Estimated percentage

Example of use of chart: An estimate of 20 percent (on scale at bottom of chart) based on an estimate of 10,000,000 has a relative standard error of 3.2 percent (read from the scale at the left side of the chart), the point at which the curve for a base of 10,000,000 intersects the vertical line for 20 percent. The standard error in percentage points is equal to 20 percent X 3.2 percent or 0.64 percentage points.

APPENDIX II

DEFINITIONS OF CERTAIN TERMS USED IN THIS REPORT

Terms Relating to Conditions

Condition.—A morbidity condition, or simply a condition, is any entry on the questionnaire which describes a departure from a state of physical or mental wellbeing. It results from a positive response to one of a series of "illness-recall" questions. In the coding and tabulating process conditions are selected or classified according to a number of different criteria, such as whether they were medically attended; whether they resulted in disability; whether they were acute or chronic; or according to the type of disease, injury, impairment, or symptoms reported. For the purposes of each published report or set of tables, only those conditions recorded on the questionnaire which satisfy certain stated criteria are included.

Acute conditions are classified by type according to the International Classification of Diseases, 1955 Revision, with certain modifications adopted to make the code more suitable for a household-interview-type survey.

Acute condition.—An acute condition is defined as a condition which has lasted less than 3 months and which has involved either medical attention or restricted activity. Because of the procedures used to estimate incidence, the acute conditions included in this report are the conditions which had their onset during the 2 weeks prior to the interview week and which involved either medical attention or restricted activity during the 2-week period. However, it excludes certain conditions which are always classified as chronic (listed below) even though the onset occurred within 3 months prior to week of interview.

· ····································	
Conditions always classi	fied as chronic:
Asthma	Stomach ulcer
Hay fever	Any other chronic
Tuberculosis	stomach trouble
Chronic bronchitis	Kidney stones or chronic
Repeated attacks of sinus	kidney trouble
trouble	Arthritis or rheumatism
Rheumatic fever	Mental illness
Hardening of the arteries	Diabetes
High blood pressure	Thyroid trouble or goiter
Heart trouble	Any allergy
Stroke	Epilepsy
Trouble with varicose veins	Chronic nervous trouble
Hemorrhoids or piles	Cancer
Tumor, cyst, or growth	Chronic skin trouble
Chronic gallbladder or	Hernia or rupture
liver trouble	Prostate trouble

Deafness or serious	Paralysis of any kind
trouble with hearing	Repeated trouble with
Serious trouble with see-	back or spine
ing, even when wearing	Club foot
glasses	Permanent stiffness or
Cleft palate	deformity of the foot,
Any speech defect	leg, fingers, arm, or
Missing fingers, hand, or	back
arm-toes, foot, or leg	Condition present since
Palsy	birth

Condition groups.—Conditions are classified according to the International Classification of Diseases, 1955 Revision, with certain modifications adopted to make the code more suitable for a household-interview survey. In this report, all tables which have data classified by type of condition employ a 5-category regrouping plus several selected subgroups. The International Classification code numbers included in each category are shown below.

Condition Groups	International Classification Code Number (excluding chronic inclusions)
Infective and parasitic diseases	020-338
Common childhood diseases The virus, N-O.S Other infective and parasitic diseases	
Respiratory conditions	470-501, 511, 517-525, 527, 783
Upper respiratory conditions Common cold Other acute upper respiratory	470
conditions Influenza	471-475, 517 480-483
menifestations	480, 481, 483 490-501, 518-525, 527, 783 490-493 500, 501
Digestive system conditions	530 -539, 543-553, 570, 571, 573. 567, 784, 785
Dental conditions Functional and symptomatic upper gastrointestimal disorders, N.E.C Other digestive system conditions	544, 784
Injuries	N800-N885, N890-N895, N900-N994, N996-N999
Fractures, diflocations, sprains, and strains	N800-N839 N840-N848 N870-N885, N890-N895, N900-N908 N910-N929
All other acute conditions	All other acute code numbers
Diseases of the ear Headaches- Cenitourinary disorders	791 590-637, 786, 789
Diseases of the Min Diceases of the musciloakeletal system All other acute conditions	690-716 726-743, 787

Terms Relating to Chronic Conditions

Condition.—A morbidity condition, or simply a condition, is any entry on the questionnaire which describes a departure from a state of physical or mental well-being. It results from a positive response to one of a series of "illness-recall" questions. In the coding and tabulating process conditions are selected or classified according to a number of different criteria, such as whether they were medically attended; whether they resulted in disability; whether they were acute or chronic; or according to the type of disease, injury, impairment, or symptom reported. For the purposes of each published report or set of tables, only those conditions recorded on the questionnaire which satisfy certain stated criteria are included.

Conditions, except impairments, are coded by type according to the International Classification of Diseases with certain modifications adopted to make the code more suitable for a household-interview-type survey.

Chronic condition.—A condition is considered to be chronic if (1) it is described by the respondent in terms of one of the chronic diseases on the "Check List of Chronic Conditions" or in terms of one of the types of impairments on the "Check List of Impairments," or (2) the condition is described by the respondent as having been first noticed more than 3 months before the week of the interview.

Impairments.—Impairments are chronic or permanent defects, usually static in nature, resulting from disease, injury, or congenital malformation. They represent decrease or loss of ability to perform various functions, particularly those of the musculoskeletal system and the sense organs. All impairments are classified by means of a special supplementary code for impairments. Hence, code numbers for impairments in the International Classification of Diseases are not used. In the Supplementary Code, impairments are grouped according to type of functional impairment and etiology.

Persons with chronic conditions.—The estimated number of persons with chronic conditions is based on the number of persons who at the time of the interview were reported to have one or more chronic conditions.

Prevalence of conditions.—In general, prevalence of conditions is the estimated number of conditions of a specified type existing at a specified time or the average number existing during a specified interval of time. The prevalence of chronic conditions is defined as the number of chronic cases reported to be present or assumed to be present at the time of the interview; those assumed to be present at the time of the interview are cases described by the respondent in terms of one of the chronic diseases on the "Check List of Chronic Conditions" and reported to have been present at some time during the 12-month period prior to the interview.

Onset of condition.—A condition is considered to have had its onset when it was first noticed. This could

be the time the person first felt sick or became injured, or it could be the time when the person or his family was first told by a physician that he had a condition of which he was previously unaware.

Incidence of conditions.—The incidence of conditions is the estimated number of conditions having their onset in a specified time period. As previously mentioned, minor acute conditions involving neither restricted activity nor medical attention are excluded from the statistics. The incidence data shown in some reports are further limited to various subclasses of conditions, such as "incidence of conditions involving bed disability."

Activity-restricting condition.— An activity-restricting condition is a condition which has caused at least 1 day of restricted activity during the 2 calendar weeks before the interview week. (See definition of "Restricted-activity day.") The incidence of acute activity-restricting conditions is estimated from the number of such conditions reported as having started in the 2-week period, but a condition which did not result in restricted activity until after the end of the 2-week period in which it had its onset is not included.

Bed-disabling condition.—A condition involving at least 1 day of bed disability is called a bed-disabling condition. (See definition of "Bed-disability day.") The incidence of acute bed-disabling conditions is defined in a manner analogous to the incidence of acute activityrestricting conditions.

Medically attended condition.—A condition is considered medically attended if a physician has been consulted about it either at its onset or at any time thereafter. Medical attention includes consultation either in person or by telephone for treatment or advice. Advice from the physician transmitted to the patient through the nurse is counted as well as visits to physicians in clinics or hospitals. If during the course of a single visit the physician is consulted about more than one condition for each of several patients, each condition of each patient is counted as medically attended.

Discussions of a child's condition by the physician and a responsible member of the household are considered as medical attention even if the child was not seen at that time.

For the purpose of this definition, the term "physician" includes doctors of medicine and osteopathic physicians.

Terms Relating to Persons Injured

Injury condition.—An injury condition, or simply an injury, is a condition of the type that is classified according to the nature of injury code numbers (N800-N999) in the International Classification of Diseases. In addition to fractures, lacerations, contusions, burns, and so forth, which are commonly thought of as injuries, this group of codes include: effects of exposure, such as sunburn; adverse reactions to immunization and other medical procedures; and poisonings. Unless otherwise specified, the term injury is used to cover all of these.

Since a person may sustain more than one injury in a single accident, e.g., a broken leg and laceration of the scalp, the number of injury conditions may exceed the number of persons injured.

Statistics of acute injury conditions include only those injuries which involved at least 1 full day of restricted activity or medical attendance.

Person injured.—A person injured is one who has sustained one or more injuries in an accident or in some type of nonaccidental violence (see definition of "Injury condition" above). Each time a person is involved in an accident or in nonaccidental violence causing injury that results in at least 1 full day of restricted activity or medical attention, he is included in the statistics as a separate "person injured;" hence, one person may be included more than once.

The number of persons injured is not equivalent to the number of "accidents" for several reasons: (1) the term "accident" as commonly used may not involve injury at all; (2) more than one injured person may be involved in a single accident so that the number of accidents resulting in injury would be less than the number of persons injured in accidents; and (3) the term "accident" ordinarily implies an accidental origin, whereas "persons injured" as used in the National Health Survey includes persons whose injury resulted from certain nonaccidental violence.

The number of persons injured in a specified time interval is always equal to or less than the incidence of injury conditions, since one person may incur more than one injury in a single accident.

Terms Relating to Class of Accident

Class of accident. - Injuries, injured persons, and resulting days of disability may be grouped according to class of accident. This is a broad classification of the types of event which resulted in persons being injured. Most of these events are accidents in the usual sense of the word, but some are other kinds of mishap, such as overexposure to the sun or adverse reactions to medical procedures, and others are nonaccidental violence, such as attempted suicide. The classes of accidents are: (1) moving motor-vehicle accidents, (2) accidents occurring while at work, (3) home accidents, and (4) other accidents. These categories are not mutually exclusive. For example, a person may be injured in a moving motor-vehicle accident which occurred while the person was at home or at work. The accident class "motor vehicle" includes "home-motor vehicle" and "while at work-motor vehicle." Similarly, the classes while at work and home, include duplicated counts, e.g., motor vehicle-while at work is included under "while at work."

Motor-vehicle accident.— The class of accident is "motor vehicle" if a motor vehicle was involved in any way. Thus, it is not restricted to moving motor vehicles or to persons riding in motor vehicles. A motor vehicle is any mechanically or electrically powered device, not operated on rails, upon which or by which any person or property may be transported or drawn upon a land highway. Any object, such as a trailer, coaster, sled, or wagon, being towed by a motor vehicle is considered a part of the motor vehicle. Devices used solely for moving persons or materials within the confines of a building and its premises are not counted as motor vehicles.

Moving motor vehicle.— The accident is classified as "moving motor vehicle" if at least one of the motor vehicles involved in the accident was moving at the time of the accident.

Nonmoving motor vehicle.—The accident is classified as "nonmoving motor vehicle" if the motor vehicle was not moving at the time of the accident.

Accident while at work.—The class of accident is "while at work" if the injured person was 17 years of age or over and was at work at a job or a business at the time the accident happened.

Home accident.— The class of accident is "home" if the injury occurred either inside the house or outside the house. "Outside the house" refers to the yard, buildings, and sidewalks on the property. "Home" includes not only the person's own home but also any other home in which he might have been when he was injured.

Other.—The class of accident is "other" if the occurrence of injury cannot be classified in one or more of the first three class-of-accident categories. This category therefore includes persons injured in public places (e.g., tripping and falling in a store or on a public sidewalk), and also nonaccidental injuries such as homicidal and suicidal attempts. The survey does not cover the military population, but current disability of various types resulting from prior injury occurring while the person was in the Armed Forces is covered and is included in this class. The class also includes mishaps for which the class of accident could not be ascertained.

Terms Relating to Disability

Disability.—Disability is the general term used to describe any temporary or long-term reduction of a person's activity as a result of an acute or chronic condition.

Disability days are classified according to whether they are days of restricted activity, bed-days, workloss days, or school-loss days. All days of bed disability are, by definition, days of restricted activity. The converse form of this statement is, of course, not true. Days lost from work and days lost from school are also days of restricted activity for the working and school-age populations. Hence, restricted activity is the most inclusive term used in describing disability days.

Condition-days of restricted activity, bed disability, etc.—Condition-days of restricted activity, bed disability, and so forth are days of the various forms of disability associated with any one condition. Since any particular day of disability may be associated with more than one condition, the sum of days for all conditions adds to more than the total number of persondays of disability.

Restricted-activity day.—A day of restricted activity is one on which a person substantially reduces the amount of activity normal for that day because of a specific illness or injury. The type of reduction varies with the age and occupation of the individual as well as with the day of the week or season of the year. Restricted activity covers the range from substantial reduction to complete inactivity for the entire day.

Bed-disability day.—A day of bed disability is one on which a person stays in bed for all or most of the day because of a specific illness or injury. It is considered to be a day only if the period of bed disability includes more than half of the daylight hours. All hospital days for inpatients are considered to be days of bed disability even if the patient was not actually in bed at the hospital.

Work-loss day.—A day lost from work is a normal working day on which a person did not work at his job or business because of a specific illness or injury. If the person's regular work day is less than a whole day and the entire work day was lost, it would be counted as a whole work day lost. The number of days lost from work is determined only for persons 17 years of age or over who reported that at any time during the 2-week period covered by the interview they either worked at or had a job or business (see "Currently employed persons").

School-loss day.—A day lost from school is a normal school day on which a child did not attend school because of a specific illness or injury. The number of days lost from school is determined only for children 6-16 years of age.

Person-days of restricted activity, bed disability, etc.—Person-days of restricted activity, bed disability, and so forth are days of the various forms of disability experienced by any one person. The sum of days for all persons in a group represents an unduplicated count of all days of disability for the group.

Terms Relating to Hospitalization

Hospital discharge.— A hospital discharge is the completion of any continuous period of stay of one or more nights in a hospital as an inpatient, except the period of stay of a well, newborn infant. A hospital discharge is recorded whenever a present member of the household is reported to have been discharged from a hospital in the 12-month period prior to the interview week. (Estimates were based on discharges which occurred during the 6-month period prior to the interview.)

Hospital.—For this survey a hospital is defined as any institution meeting one of the following criteria: (1) named in the listing of hospitals in the current Guide Issue of *Hospitals*, the Journal of the American Hospital Association; (2) named in the listing of hospitals in the Directories of the American Osteopathic Hospital Association; or (3) named in the annual inventory of hospitals and related facilities submitted by the States to the Division of Hospital and Medical Facilities of the U.S. Public Health Service in conjunction with the Hill-Burton program.

Hospital ownership,—Hospital ownership is a classification of hospitals according to the type of organization that controls and operates the hospital. The category to which an individual hospital is assigned and the definition of these categories follows the usage of the American Hospital Association.

Type of hospital service.—Type of hospital service is a classification of hospitals according to the predominant type of cases for which they provide care. The category to which an individual hospital is assigned and the definition of these categories follows the usage of the American Hospital Association.

Short-stay hospital.— A short-stay hospital is one for which the type of service is general; maternity; eye, ear, nose, and throat; children's; osteopathic hospital; or hospital department of institution.

Terms Relating to Corrective Lenses

Corrective lenses— Corrective lenses include eyeglasses, contact lenses, or both. It is limited to visual aids worn to correct or improve vision and therefore excludes sunglasses worn only to filter light, safety glasses worn only for protection of the eyes, hand magnifying glasses, and other such devices. However, if the safety glasses are worn also for correction or improvement of vision, they would then be considered corrective lenses, as would prescription sunglasses.

Demographic Terms

Age.—The age recorded for each person is the age at last birthday. Age is recorded in single years and grouped in a variety of distributions depending upon the purpose of the table.

Currently employed persons.—Currently employed persons are all persons 17 years of age or over who reported that at any time during the 2-week period covered by the interview they either worked at, or had a job or business. Current employment includes paid work as an employee of someone else, self-employment in business, farming, or professional practice, and unpaid work in a family business or farm. Persons who were temporarily absent from their job or business because of a temporary illness, vacation, strike, or bad weather are considered as currently employed if they expected to work as soon as the particular event causing their absence no longer existed.

Free-lance workers are considered as currently employed if they had a definite arrangement with one or

more employers to work for pay according to a weekly or monthly schedule, either full time or part time. Excluded from the currently employed are such persons who have no definite employment schedule but work only when their services are needed.

Also excluded from the currently employed population are (1) persons receiving revenue from an enterprise in whose operation they did not participate. (2) persons doing housework or charity work for which they receive no pay, and (3) seasonal workers during the portion of the year they were not working.

The number of currently employed persons estimated by the National Health Survey (NHS) will differ from the estimates prepared by the Current Population Survey (CPS), Bureau of the Census, for several reasons. In addition to sampling variability they include three primary conceptual differences, namely: (1) NHS estimates are for persons 17 years of age or over; CPS estimates are for persons 14 years of age or over. (2) NHS uses a 2-week-reference period, while CPS uses a 1-week-reference period. (3) NHS is a continuing survey with separate samples taken weekly, while CPS is a monthly sample taken for the survey week which includes the 12th of the month.

APPENDIX III. QUESTIONNAIRE

The items below show the exact content and wording of the basic questionnaire used in the nationwide household survey of the U.S. National Health Survey. The actual questionnaire is designed for a household as a unit and includes additional spaces for reports on more than one person, condition, accident, or hospitalization. Such spaces are omitted in this illustration.

1.a. What is the name of the head of this household? (Enter name in column for Person 01)	PERSON()
b. What are the names of all other persons who live here? (List all persons who live here) c. I have listed (read names). Is there anyone else staying here now such as friends,	LAST NAME
relatives, or roomers?	
d. Have I missed anyone who USUALLY lives here but is now away from home?	
If any adult males listed, ask: *Apply household membership rules	FIRST NAME
f. Are any of the persons in this household now on full-time active duty with Yes (Delete) NO the Armed Forces of the United States?	
2. How is related to (head of household)?	RELATIONSHIP Head
3. How old was on his last birthday? (Also mark Race and Sex)	AGE RACE White SEX
If 17 years old or over, ask:	Und. 17 Never married
4. Is now married, widawed, divorced, separated, or never married? (Mark one box for each person) If persons under 17 are or have been married mark the "Und. 17" box and give marital status in a footnote.	Married Divorced Widowed Separated
If 17 years old or over, ask:	Under 17
5. What was doing most of the past 12 months -	Working
(for males) working or doing something else?	Keeping house
(for females) keeping house, working or doing samething else?	
If related persons 19 years old or over are listed in addition to the respondent, say: We would like to have all adults who are at home take part in the interview. Is your, etc., at home now?	At home (Interview for self)
If other eligible respondents are at home, ask:	Under 19
Would you please ask,, etc., to join us?	Not at home
This survey covers all kinds of illnesses. These first questions refer to LAST WEEK AND THE WEEK BEFORE, that is, the 2-week period outlined in red on this calendar. (Hand calendar) 6.a. Was – sick at any time LAST WEEK OR THE WEEK BEFORE? (the 2 weeks shown on that calendar)? b. What was the matter? c. Did – have anything else during that 2-week period?	□ Yes (0) □ No
7.a. LAST WEEK OR THE WEEK BEFORE, did take any medicine or treatment for any condition (besides	□ Yes □ No
which you told me about)?	
 b. For what condition? c. Did take any medicine for any other condition? 	
8.a. LAST WEEK OR THE WEEK BEFORE, did have any accidents or injuries?	Yes No
 b. What were they? c. Did have any other accidents or injuries during that 2-week period? 	
9.a. Did – ~ EVER have an (any other) accident or injury that still bothers him or affects him in anyway? b. In what way does it bother him? (Record present affects)	Yes No
Open your Flashcard Booklet to Card A. 10. Read both sides of Card A, condition by condition; record in his column any conditions mentioned for the person.	Yes (1) No
Turn to Card B. 11. Read both sides of Card B, condition by condition; record in his column any conditions mentioned for the person.	Yes No
12.a. Does have any other ailments, conditions, or problems with his health?	Yes No
b. What is the condition? (Record condition itself if still present; otherwise record present effects.) c. Any other problems with his health?	:
	Yes No
If "Yes," ask: rest homes or similar places.	No. of times
b. How many times was - in a hospital during that period? (Examine ages in guestion 3 for babies 1 year old or under. For each child 1 year old or under, ask 14a.)	Month Day Year
14.0. When was born? (If on or after the date stamped in 13e, ask 14b.)	
b. Was born in a haspital? { If "Pes," and no hospitalizations entered in his column, enter "1" in 13b } If "Yes," and a hospitalization is reported for the mother and baby, ask 14c. }	
c. Is this hospitalization included in the number you gave me for $?$ (If "No," correct entry for mother and baby)	<u>Yes 01 No</u>
R For persons 19 years old or over, show who responded for (or was present during the asking of) Q. 6-14. It persons responded for sell, show whether entirely or partly. For persons under 19 show who responded for them. If eligible respondent is "at home" but did not respond for sell, enter the reason in a footnote.	Responded for self-entirely Responded for self-partly Person was respondent

OUTLINE OF REPORT SERIES FOR VITAL AND HEALTH STATISTICS

Public Health Service Publication No. 1000

- Series 1. Programs and collection procedures.—Reports which describe the general programs of the National Center for Health Statistics and its offices and divisions, data collection methods used, definitions, and other material necessary for understanding the data.
- Series 2. Data evaluation and methods research.—Studies of new statistical methodology including: experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, contributions to statistical theory.
- Series 3. Analytical studies.—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- Series 4. Documents and committee reports.—Final reports of major committees concerned with vital and health statistics, and documents such as recommended model vital registration laws and revised birth and death certificates.
- Series 10. Data from the Health Interview Survey.—Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, based on data collected in a continuing national household interview survey.
- Series 11. Data from the Health Examination Survey.—Data from direct examination, testing, and measurement of national samples of the population provide the basis for two types of reports: (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics; and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- Series 12. Data from the Institutional Population Surveys.—Statistics relating to the health characteristics of persons in institutions, and on medical, nursing, and personal care received, based on national samples of establishments providing these services and samples of the residents or patients.
- Series 13. Data from the Hospital Discharge Survey.—Statistics relating to discharged patients in short-stay hospitals, based on a sample of patient records in a national sample of hospitals.
- Series 20. Data on mortality.—Various statistics on mortality other than as included in annual or monthly reports—special analyses by cause of death, age, and other demographic variables, also geographic and time series analyses.
- Series 21. Data on natality, marriage, and divorce. Various statistics on natality, marriage, and divorce other than as included in annual or monthly reports—special analyses by demographic variables, also geographic and time series analyses, studies of fertility.
- Series 22. Data from the National Natality and Mortality Surveys. --Statistics on characteristics of births and deaths not available from the vital records, based on sample surveys stemming from these records, including such topics as mortality by socioeconomic class, medical experience in the last year of life, characteristics of pregnancy, etc.
