Urinary Tract Infection (UTI) Event for Long-term Care Facilities

**Background:** The urinary tract is one of the most common sites of healthcare-associated infections, accounting for 20-30% of infections reported by long-term care facilities (LTCFs). In the LTC resident, risk factors for developing bacteriuria and UTI include age-related changes to the genitourinary tract, comorbid conditions resulting in neurogenic bladder, and instrumentation required to manage bladder voiding. The point prevalence of asymptomatic bacteriuria in LTC residents can range from 25-50%. Although the incidence of symptomatic UTI is lower, it still comprises a significant proportion of infections manifesting in LTCFs and results in a large amount of antibiotic use.

Though prevalence of indwelling urinary catheter use in LTCFs is lower than in the acute care setting, catheter-associated UTI (CAUTI) can lead to such complications as cystitis, pyelonephritis, bacteremia, and septic shock. These complications associated with CAUTI can result in decline in resident function and mobility, acute care hospitalizations, and increased mortality. Prevention of CA-UTIs is discussed in the CDC/HICPAC document, *Guideline for Prevention of Catheter-associated Urinary Tract Infections*.

**Settings:** UTI Event reporting is currently available for certified skilled nursing facilities/nursing homes (LTC:SKILLNURS), and intermediate/chronic care facilities for the developmentally disabled (LTC:DEVDIS). Infection surveillance for UTIs should be performed facility-wide (FacWideIN).

NOTE: If a resident is transferred from an acute care facility and develops signs/symptoms of a UTI within the first 2 calendar days of admission (where date of admission = day 1) to the LTCF, it would be considered present at the time of transfer to the LTCF. An event present at the time of transfer should be reported back to the transferring facility and not reported to NHSN as a LTCF UTI event. Only UTI events presenting > 2 calendar days after admission (where date of admission= day 1) are considered facility onset events.
Example: NHSN Classification of reportable LTCF UTI Events

**Requirements:** Facilities must indicate their surveillance for UTI in the *Monthly Reporting Plan for LTCF* (CDC 57.141). UTI surveillance must be reported for at least 6 consecutive months to provide meaningful measures.

**Definitions:**

*Date of Event* is defined as the date when the *first clinical evidence (signs/symptoms) of the UTI appeared* or the *date the specimen was collected* that was used to make or confirm the diagnosis, whichever comes first.

*Urinary tract infections (UTI)* are defined using a combination of clinical signs and symptoms and laboratory criteria (See Figure 1 and Table 1).

*Symptomatic UTI (SUTI)* events occur when the resident manifests signs and symptoms such as acute dysuria, new and/or marked increase in urinary frequency, suprapubic tenderness, etc. which localize the infection to the urinary tract. These events can occur in residents without urinary devices or managed with urinary devices other than indwelling urinary catheters, such as suprapubic catheters, straight in-and-out catheters and condom catheters. Events occurring in residents with indwelling urinary catheters (defined below) are a sub-set of SUTIs referred to as catheter-associated SUTI (CA-SUTI) events.

*Indwelling urinary catheter:* a drainage tube that is inserted into the urinary bladder *through the urethra*, is left in place, and is connected to a closed collection system; also called a Foley catheter. Indwelling urinary catheters do not include straight in-and-out catheters or suprapubic catheters.

*NOTE:* An indwelling urinary catheter should be in place for a minimum of 2 calendar days before infection onset (where day of catheter insertion = day 1) in order for the SUTI to be catheter-associated.

*Indwelling urinary catheter:* a drainage tube that is inserted into the urinary bladder *through the urethra*, is left in place, and is connected to a closed collection system; also called a Foley catheter. Indwelling urinary catheters do not include straight in-and-out catheters or suprapubic catheters.

*NOTE:* UTIs in residents managed with suprapubic, in and out, or condom (males only) catheters will be captured as SUTIs, not CA-SUTIs.
Asymptomatic Bacteremic UTI (ABUTI) events occur when the resident has NO signs or symptoms localizing to the urinary tract but has urine and blood cultures positive for at least one common organism (See Table 1) regardless of whether a catheter is in place or not.

Numerator and Denominator Data:

**Numerator Data:** The Urinary Tract Infection (UTI) for LTCF form (CDC 57.140) is used to collect and report each SUTI, CA-SUTI or ABUTI that is identified during the month selected for surveillance. The Tables of Instructions includes information on how to complete this form.

The UTI form includes resident demographic information and information on whether or not a catheter (or other urinary device) was present. Additional data include the specific clinical criteria evidence (signs and symptoms) and laboratory and diagnostic testing that were used for identifying the UTI; whether the resident developed a secondary bloodstream infection; whether the resident was transferred to an acute care facility for any reason within 7 days of the UTI event or died from any cause within 30 days of the UTI event; and the organisms isolated from cultures and their antimicrobial susceptibilities.

**Denominator data:** Catheter-days and resident-days are used for denominators. Catheter-days, defined as the number of residents with an indwelling urinary (Foley) catheter, are collected daily for all residents in the facility using the Denominators for LTCF form (CDC 57.142). Resident-days are calculated using the daily census of residents in the facility each day of the month. These daily counts are summed and only the total for the month is entered into NHSN, under Summary Data. None of the following urinary management devices should be included when counting indwelling catheter-days: suprapubic catheters, straight in-and-out catheters or condom catheters.

NOTE: If a resident is transferred to an acute care facility for a suspected UTI, no additional indwelling catheter-days are reported after the day of transfer.
Data Analyses:

Line lists of UTI events and UTI events by catheter status will be available as part of the UTI event within the NHSN LTCF component. Below are measures and calculations which will be incorporated into the analytics output that will be available for use in 2013.

Calculated UTI Rates and Metrics
Data will be stratified by time (e.g., month, quarter) and aggregated across the entire facility.

Total UTI incidence rate/1,000 resident-days = Number of UTI Events (i.e., SUTI+CA-SUTI+ABUTI) / Total resident-days x 1,000.

Percent that is SUTI = Number of SUTI Events / Total number of UTI Events x 100.

Percent that is CA-SUTI = Number of CA-SUTI Events / Total number of UTI Events x 100.

Percent that is ABUTI = Number of ABUTI Events / Total number of UTI Events x 100.

SUTI incidence rate/1,000 resident-days = Number of SUTI Events / (Total resident-days – catheter-days) x 1,000.

NOTE: Only SUTIs which are NOT catheter-associated will be included in the SUTI incidence rate.

CA-SUTI incidence rate/1,000 catheter-days = Number of CA-SUTI events/ Catheter-days x 1,000

NOTE: Only symptomatic events which develop at the time an indwelling catheter is in place or recently removed (within last 2 calendar days) will contribute to the CA-SUTI rate.

Urinary Catheter Utilization Ratio = Total urinary catheters-days / Total resident-days.
Figure 1: Criteria for Defining UTI Events in NHSN LTCF Component.

**Resident without an indwelling catheter** (Meets criteria 1a OR 2a OR 3a):

### SUTI – Criteria 1a
Either of the following:
1. Acute dysuria
2. Acute pain, swelling or tenderness of the testes, epididymis or prostate

### SUTI – Criteria 2a
Either of the following:
1. Fever
2. Leukocytosis

**AND**

ONE or more of the following:
- Costovertebral angle pain or tenderness
- New or marked increase in suprapubic tenderness
- Gross hematuria
- New or marked increase in incontinence
- New or marked increase in urgency
- New or marked increase in frequency

### SUTI – Criteria 3a
TWO or more of the following:
- Costovertebral angle pain or tenderness
- New or marked increase in suprapubic tenderness
- Gross hematuria
- New or marked increase in incontinence
- New or marked increase in urgency
- New or marked increase in frequency

**AND**

Either of the following:
1. A voided urine culture with \( \geq 10^5 \) CFU/ml of no more than 2 species of microorganisms
2. Positive culture with \( \geq 10^2 \) CFU/ml of any microorganisms from straight in/out catheter specimen

---

*a* Fever: Single temperature \( \geq 37.8°C (>100°F) \), or \( > 37.2°C (>99°F) \) on repeated occasions, or an increase of \( >1.1°C (>2°F) \) over baseline

*b* Leukocytosis: \( >14,000 \) cells/mm\(^3\), or Left shift (> 6% or 1,500 bands/mm\(^3\))
 Resident with an indwelling catheter:

CA-SUTI – Criteria

ONE or more of the following with no alternate source:

- Fever
- Rigors
- New onset hypotension, with no alternate site of infection.
- New onset confusion/functional decline AND Leukocytosis
- New costovertebral angle pain or tenderness
- New or marked increase in suprapubic tenderness
- Acute pain, swelling or tenderness of the testes, epididymis or prostate
- Purulent discharge from around the catheter

AND

Any of the following:

If urinary catheter removed within last 2 calendar days:

1. A voided urine culture with $\geq 10^5$ CFU/ml of no more than 2 species of microorganisms
2. Positive culture with $\geq 10^2$ CFU/ml of any microorganisms from straight in/out catheter specimen

If urinary catheter in place:

3. Positive culture with $\geq 10^5$ CFU/ml of any microorganisms from indwelling catheter specimen

CA-SUTI

---

\(^a\) Fever: Single temperature $\geq 37.8^\circ C (>100^\circ F)$, or $> 37.2^\circ C (>99^\circ F)$ on repeated occasions, or an increase of $>1.1^\circ C (>2^\circ C)$ over baseline

\(^b\) Leukocytosis: $>14,000$ cells/mm$^3$, or Left shift ($> 6\%$ or $1,500$ bands/mm$^3$)
Resident with or without an indwelling catheter:

ABUTI – Criteria

Resident has no localizing urinary signs or symptoms (i.e., no urgency, frequency, acute dysuria, suprapubic tenderness, or costovertebral angle pain or tenderness). *If no catheter is in place, fever alone would not exclude ABUTI if other criteria are met.*

AND

Any of the following:
1. A voided urine culture with \( \geq 10^5 \) CFU/ml of no more than 2 species of microorganisms
2. Positive culture with \( \geq 10^2 \) CFU/ml of any microorganisms from in/out catheter specimen
3. Positive culture with \( \geq 10^5 \) CFU/ml of any microorganisms from indwelling catheter specimen

AND

Positive blood culture with at least 1 matching organism in urine culture

ABUTI
