*Case Definition

Did patient receive non-irradiated blood product(s) in the two months preceding the reaction? Yes No

Check all that occurred within 2 days to 6 weeks after cessation of transfusion:

- Clinical syndrome
Clinical syndrome characteristics: Diarrhea Fever Hepatomegaly Pancytopenia
 Liver dysfunction (i.e., elevated ALT, AST, Alkaline phosphatase, and bilirubin) Marrow aplasia
 Characteristic rash: erythematous, maculopapular eruption centrally that spreads to extremities and may, in severe cases, progress to generalized erythroderma and hemorrhagic bullous formation.

Check all that apply:

- Characteristic histological appearance of skin or liver biopsy.
 Biopsy negative or not done.

***Severity**

Did the patient receive or experience any of the following?

No treatment required Symptomatic treatment only

Hospitalization, including prolonged hospitalization Life-threatening reaction

Disability and/or incapacitation Congenital anomaly or birth defect(s) of the fetus

Other medically important conditions Death Unknown or not stated

***Imputability**

Which best describes the relationship between the transfusion and the reaction?

No other alternative diagnoses.

Other potential causes are present (e.g., stem cell transplantation).

Alternative explanations are more likely (e.g., solid organ transplantation).

Evidence is clearly in favor of a cause other than the transfusion, but transfusion cannot be excluded.

There is conclusive evidence beyond reasonable doubt of a cause other than the transfusion

The relationship between the adverse reaction and the transfusion is unknown or not stated.

Did the transfusion occur at your facility? YES NO

WBC chimerism: WBC chimerism present WBC chimerism not present or not done

Module-generated Designations

NOTE: Designations for case definition, severity, and imputability will be automatically assigned in the NHSN application based on responses in the corresponding investigation results section above.
