Closed-Circuit Breathing Apparatus
Development of Performance Requirements

Concept

Evaluation of CCBA requires three areas of scrutiny:
CAPACITY - How far will this apparatus carry me? How many liters of usable oxygen are in it?
PERFORMANCE - What are its characteristics in terms of stressors; i.e. levels of CO₂ and O₂, temperature and pressure?
WEARABILITY - Human interface - i.e., if I bend over, will it cut or burn me? Does it interfere with my activities?

Any testing protocol addressing these three levels of scrutiny must include:
- A quantitative workload
- Continuously monitored stressor levels
- Test termination only when oxygen supply is expended or if a stressor exceeds a safe limit
- Apparatus classified by quantity of usable oxygen

Old versus New

Current tests:
- specify activities rather than work load;
- provide for monitoring stressors only occasionally;
- end at predetermined times;
- classify apparatus by duration, affected by user's weight and activity.

Proposed tests:
- specify quantitative workload;
- provide for continuous monitoring of stressors;
- terminate only when oxygen supply is expended or if stressor limits are exceeded;
- classify apparatus by liters of usable oxygen.

Three tests - three areas of scrutiny

Capacity
- Run at a constant, moderately high work-rate.
- Run until empty.
Performance
- Monitor apparatus performance at high and low work rates while various components are operating.
- Evaluate performance of entire apparatus, not individual components.
- Repeat 30-minute, 50-L cycle until empty.
Wearability
- Evaluate ergonomics.

Stressor limits based on physiology

- Continuously monitored physiology-based stressor limits shall not be exceeded for longer than one minute in any test.
- Most presently certified CCBA exceed the proposed one-minute limits when monitored continuously.

Monitored Stressors, Acceptable Ranges

Stressor limits are given as permissible averaged over entire test and over any one-minute period.

Closed-Circuit Self-Contained Breathing Apparatus (CC-SCBA) Program
Frank Palya Jr.

Goal
Develop new performance requirements for the Closed-Circuit Self-Contained Breathing Apparatus (CC-SCBA) and promulgate them as regulations into Title 42 CFR Part 84 which includes the following:

- Based on latest credible human physiological factor limits and ergonomics
- Allow latest technology and innovative designs be tested and have flexibility to accommodate future technology
- Ensure NIOSH-certified apparatus provides adequate protection to the wearer and are "safe-to-use"
- Incorporate into Standard Test Procedures (STPs) the required use of test equipment that employs state-of-the-art technology to test the performance requirements
- Provide Chemical, Biological, Radiological and Nuclear (CBRN) protection (optional requirements)
- Provide fire resistant protection: high radiant heat and flame resistance (optional requirements)

Summary of Conceptual Changes, CC-SCBA, Subpart Q

Description
Subpart Q is a new module that contains exclusively the requirements of Pressure Demand and Demand types of Closed-Circuit SCBA designed for entry and escape from Immediately Dangerous to Life and Health (IDLH) atmospheres

Facepiece
Add a Laboratory Respiratory Protection Level (LRPL) performance requirement intended to be replaced by a Total Inner Leakage test requirement

Eye Piece
Add field of view, fogging resistance, haze and luminous transmittance, and abrasion resistance performance requirements, and update impact resistance performance requirements

Breathing Bag
Add a kerosene and toluene vapor permeation resistance performance requirement

Breathing Performance
Implement the use of an Automated Breathing and Metabolic Simulator (ABMS) to test the breathing performance of the apparatus for human stressor needs of CO, O2, breathing pressures and wet-bulb temperature outputs. Breathing performance includes Capacity, Performance and Wearability requirements which will be tested with both the ABMS and human subjects. Replace service time rating with a Capacity rating

Operational Performance
Update Operational performance requirements tested both at ambient temperature and at a manufacturer's recommended lower temperature

CBRN Performance
Include optional CBRN performance requirements:
- Human stressor to be compliant with NFPA requirements
- Temperature-Extreme Operational Performance
- Durability of vibration endurance, corrosion resistance and dust resistance
- Communication Performance
- Chemical agent resistance to sulfur mustard (HD) and sarin (GB)

Fire Fighter Protection
Include optional high heat and flame resistance performance requirements:
- Operational performance of the apparatus when exposed to the high heat and open flame test specified in Section 8.11 of NFPA 1981-2007

Other performance requirements include the following:
- Fabric flame resistance
- Fabric heat resistance
- Thread heat resistance

Expected Outputs

- Elimination of obsolete requirements with new regulation
- Update or add STPs and Standard Operating Procedures (SOPs) for testing current, new, CBRN, and high heat and flame resistance performance requirements
- Allow for flexibility for greater variety of CC-SCBA designs to be certified
- Certified CBRN CC-SCBA with optional high heat and flame resistance properties
- Availability of CC-SCBA for use in CBRN and high radiant heat and flame environments (If current limitation on CC-SCBA use in high heat and flame environments is repealed)
- Final rule stated in Title 42 CFR Part 84, Subpart Q

Expected Outcomes

Improve CC-SCBA performance for traditional users such as mine rescue teams and for potential new users such as the military, first responder and fire service communities

Poster Topic Sequence

The following topics are covered in the remaining CC-SCBA posters:
1. Base Performance Requirements
2. Development of Capacity, Performance, and Wearability Requirements
3. Chemical, Biological, Radiological and Nuclear (CBRN) Optional Requirements
4. CBRN (continued) and Firefighter Protection Optional Requirements
5. NIOSH O2 Prohibition
6. Standard Test Procedures

Partners
U.S. Army Research, Development and Engineering Command (RDECOM), Occupational Safety and Health Administration (OSHA), Respirator Manufacturers and Mine Safety and Health Administration (MSHA)

Stakeholders
User groups and manufacturing organizations including United Mine Workers of America (UMWA), International Association of Fire Fighters (IAFF), International Association of Fire Chiefs (IAFC), InterAgency Board (IAB) for Equipment Standardization, Bituminous Coal Operators Association (BCOA), National Mining Association (NMA), United Steel Workers of America (USWA) and Internal Safety Equipment Association (ISEA)

Milestones
3QFY08
Post the concept paper containing the draft CC-SCBA performance requirements on the NIOSH website
Present and discuss the draft performance requirements at NIOSH Public Meeting
4QFY08
Post on the NIOSH website a revised concept paper developed on comments received at the 3QFY08 Public Meeting and information sent to Dockets #6359 and #123

Disclaimer: The findings and conclusions in this poster have not been formally disseminated by the National Institute for Occupational Safety and Health and should not be construed to represent any agency determination or policy

CDC

NIOSH
NPPTL Research to Practice through Partnerships
Goal
Develop new performance requirements for the Closed-Circuit Self-Contained Breathing Apparatus (CC-SCBA) and promulgate them as regulations into Title 42 CFR Part 94.

Partners
U.S. Army RDECOM, NIOSH, NFPA and MSHA

Stakeholders
User groups and manufacturing organizations including UMWA, IAFF, IACP, IAE, BCGA, NMA, USWA and ISEA

Full facepiece - LRPL
- The CC-SCBA shall have a measured LRPL value greater than or equal to 10,000 when the entire CC-SCBA is tested (minimum of 8 tested).
- The measured LRPL value for the CC-SCBA facepiece shall be greater than or equal to 500 when the CC-SCBA facepiece is tested using an adapter and P-100 filter (approximately 11-25 tested).

Facepiece Lens
Shall be designed and constructed to be impact and penetration resistant by meeting the requirements of ANSI Z87.1-2003.

Permeability resistance
CC-SCBAs shall be tested for 8-hour durations in:
- one unit in a gasoline saturated atmosphere;
- one unit in a kerosene saturated atmosphere; and
- one unit in a toluene saturated atmosphere.

The CC-SCBA shall be operated during these tests by a breathing machine set at 24 revolutions per minute (rpm), 40 liter minute-volume, and a work rate of 622 kg - minute.

The breathing air in the CC-SCBA shall not contain more than:
- 100 parts per million (ppm) of gasoline vapor,
- 14 ppm of kerosene vapor,
- 50 ppm of toluene vapor at the conclusion of each of the respective tests.

Monitored Stressors and their Acceptable Operating Averages and Excursions

<table>
<thead>
<tr>
<th>Stressor</th>
<th>Acceptable Operating Averages</th>
<th>Acceptable Excursions</th>
</tr>
</thead>
<tbody>

<td>&lt; 43°C (109.4° F)</td>
<td>&lt; 50°C (122.0° F)</td>
</tr>
</tbody>
</table>

Notes:
- An excursion is considered to be going outside an acceptable range for more than one minute.
- Operating averages are minute averages averaged over the entire duration of the test.

Capacity Test Requirements
Four (4) CC-SCBAs will be tested as follows:
- Two (2) each on a NIOSH automated breathing and metabolic simulator (ABMS)
- One (1) each on an ABMS after being cold soaked, for a minimum of 24 hours, at the cold-temperature limit recommended by the applicant.
- One (1) each by a human subject on a treadmill.

The capacity rating will be determined by multiplying the lowest duration obtained in any of the Capacity tests by the oxygen consumption rate, 1.35 L/min, rounded down to the nearest 5 L increment. In addition to the capacity rating, in parentheses on the label shall be given the corresponding duration obtained in the Capacity test as an expected duration for a user of average weight at a moderately high work rate.

</table>
(2) CC-SCBA - Development of Capacity, Performance, and Wearability Requirements
Nicholas Kyriazi

Concept

Evaluation of CC-SCBA requires three areas of scrutiny:
CAPACITY - How far will this apparatus carry me? How many liters of usable oxygen are in it?
PERFORMANCE - What are its characteristics in terms of stressors; i.e., levels of CO₂ and O₂, temperature and pressure?
WEARABILITY - Human interface; i.e., if I bend over, will it cut or burn me? Does it interfere with my activities?

Any testing protocol addressing these three areas of scrutiny must include:
- A quantitative work load
- Continuously monitored stressor levels
- Test termination only when oxygen supply is expended or if a stressor exceeds a safe limit
- Apparatus classified by quantity of usable oxygen

Old versus New

Current tests:
- specify activities rather than work load;
- provide for monitoring stressors only occasionally;
- end at predetermined times;
- classify apparatus by duration, affected by user's weight and activity.

Proposed tests:
- specify quantitative workload;
- provide for continuous monitoring of stressors;
- terminate only when oxygen supply is expended;
- classify apparatus by liters of usable oxygen.

Three tests - three areas of scrutiny

Capacity
- Run at a constant, moderately high work-rate.
- Run until usable oxygen is expended.

Performance
- Monitor apparatus performance at high and low work rates.
- Evaluate performance of apparatus, not individual components.
- Repeat 30-minute, 50-L cycle until usable oxygen is expended.

Wearability
- Evaluate ergonomics.

Stressor limits based on physiology

- Continuously monitored physiology-based stressor limits shall not be exceeded for longer than one-minute in any test.
- Most presently certified CC-SCBA exceed the proposed one-minute limits when monitored continuously.

Monitored Stressors, Acceptable Ranges

Stressor limits are given as permissible averaged over entire test and over any one-minute period.

<table>
<thead>
<tr>
<th>Stressor</th>
<th>Acceptable Range Operating Average</th>
<th>Acceptable Range Excursion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average inhaled CO₂</td>
<td>&lt; 1.3%</td>
<td>≤ 4.0%</td>
</tr>
<tr>
<td>Average inhaled O₂</td>
<td>&gt; 19.5%</td>
<td>≥ 15.0%</td>
</tr>
<tr>
<td>Peak Breathing Pressures (pt)</td>
<td>50-100 mm Hg</td>
<td>300-1000 mm Hg</td>
</tr>
<tr>
<td>Peak Breathing Pressures (pt)</td>
<td>50-100 mm Hg</td>
<td>300-1000 mm Hg</td>
</tr>
<tr>
<td>End-of-breath wet-bulb temperature(1)</td>
<td>&lt;43°C (109.4 °F)</td>
<td>≤ 50°C (122.0 °F)</td>
</tr>
</tbody>
</table>

(1) Wet-bulb temperature is a measurement of the temperature of a wet surface. It represents the temperature of the inhaled breathing gas in the CC-SCBA user's trach.

Disclaimer: The findings and conclusions in this poster have not been formally disseminated by the National Institute for Occupational Safety and Health and should not be construed to represent any agency determination or policy.

Capacity Test

<table>
<thead>
<tr>
<th>O₂ consumption rate (VO₂) (L/min)</th>
<th>CO₂ production rate (VCO₂) (L/min)</th>
<th>Ventilation rate (Ve) (L/min)</th>
<th>Respiratory frequency (RF) (Breaths/min)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.35</td>
<td>1.15</td>
<td>30</td>
<td>18</td>
</tr>
</tbody>
</table>

- The capacity rating will be determined by multiplying the lowest duration obtained in any of the Capacity tests by the oxygen consumption rate. 1.35 L/min rounded down to the nearest 0.5 increment. In addition to the capacity rating, in parentheses on the label shall be given the corresponding duration obtained in the Capacity test as an expected duration for a user of average weight at a moderately high work rate.

Advantages of rating by capacity rather than by duration
- The duration obtained from a CC-SCBA is inversely proportional to the use rate. Capacity is largely unaffected by use rate.

CDC Workplace Safety and Health
NIOSH NPPTL Research to Practice through Partnerships
(3) CC-SCBA - Chemical, Biological, Radiological and Nuclear (CBRN) Optional Requirements

Jonathan Szalajda

CBRN Requirements

§84.521 Chemical, biological, radiological, and nuclear (CBRN) CC-SCBA; Optional requirements; for Use Against CBRN Agents.

(a) A CC-SCBA designed for use as respiratory protection during entry into IDLH CBRN hazardous atmospheres shall meet or exceed the optional performance requirements specified in §84.521 through §84.526 of Subpart Q.

(b) NIOSH approval is obtained for CBRN Protection after it has been determined by NIOSH that the device has met the minimum performance requirements in §48.160 through §48.162.

§84.522 Additional Requirements for CBRN CC-SCBA:

(a) Operational Performance test is to evaluate the performance of the CC-SCBA and not the capacity.

(b) The CC-SCBA shall not exceed the ranges of human stressors listed in Table 5. An excursion is considered as going outside an acceptable range for more than one minute. Operating averages are minute averages averaged over the entire duration of the test.

(c) The CC-SCBA shall be tested on an automated breathing and metabolic simulator (ABMS) in accordance with the Test Regimen of Table 6 that consists of the Test Parameters and Workloads described in Table 6a and the Test Time Duration per Assigned Workload described in Table 6b.

Refer to Draft Subpart Q; Closed-Circuit Self-Contained Breathing Apparatus-May 23, 2008 for other requirements and test conditions of this section.

* RBA - Cold temperature limit Recommended By Applicant (RBA) under § 84.522(c)(8).

§84.524 Environmental Test Requirements for CBRN Use.

The CC-SCBA shall meet the Operational Performance requirements of §84.522(a), (b)(1), (b)(2) and (b)(3) and all control or operating features of the apparatus shall properly function, as specified in the apparatus’ User's Instructions, after being subjected to the following Environmental test conditions:

(1) The unrestrained vibration shock with the CC-SCBA placed in a holding box that meets the compartment dimensional requirements of Section 4.3.4.2 of NFPA 1981-2007 Edition. The vibration movement on the test table bed of a 25.4 mm (1 inch) orbital path operating in synchronous mode at 250 rpm, ± 5 rpm for a period of 3 hours.

(2) The accelerated corrosion test conditions shall be performed in accordance with MIL-STD-810F, Environmental Test Methods, Method E060.4, Salt Fog. The CC-SCBA and consumable components shall be exposed to a 5 percent ± 1 percent salt fog for 24 hours. After the 24-hour salt fog exposure, the CC-SCBA shall be removed from the salt fog chamber and be placed in a drying chamber set at 35°C ± 2°C (95°F ± 3.6°F) for 24 hours; then exposed to a second 24-hour cycle of salt fog and drying period.

(3) The particulate test conditions shall be performed in accordance with MIL-STD-810F, Method 613.4, Procedure 1 - Blowing Dust as described:

(a) The CC-SCBA and components shall be mounted on a test manikin integrated with the NIOSH ARM.

(b) The ARM shall be operated at work load B as defined in Table 6a. The test duration shall be one hour.

(i) Air velocity: 533.4 m/min ± 76.2 m/min (1750 ft/min ± 250 ft/min)

(ii) Temperature: 22°C ± 2°C (71.6°F ± 3.6°F)

Disclaimer: The findings and conclusions in this paper have not been formally disseminated by the National Institute for Occupational Safety and Health and should not be construed to represent any agency determination or policy.
Chemical, Biological, Radiological and Nuclear (CBRN) Requirements

§ 84.625 Communications Performance Requirement for CBRN Use.
(a) The CC-SCBA shall have a means of communication capable of achieving an average calculated value of not less than 60 percent when tested in accordance with Section 6.10 of the National Fire Protection Association (NFPA) 1981, Standard on Open-Circuit Self-Contained Breathing Apparatus for Fire Emergency Services-2007 Edition.
(b) Under the authority stated in § 84.625(c), NIOSH will make the determination in the future whether to require the performance requirement stated in § 84.625(a) and § 84.626(a) through § 84.631(a) be tested in accordance with the NFPA 1981-2007 Edition or a later Edition of NFPA 1981 for new applications when NIOSH deems the later Edition of NFPA 1981 serves as a more thorough test or is more beneficial to establish the quality, effectiveness and safety of the CC-SCBA. The test method described in the later Edition shall be equal to or more stringent as the test described in the current NFPA 1981-2007 Edition. If deemed necessary, NIOSH will revise the Edition in this document by Policy Letter and will inform all interested parties by writing a Letter to All Interested Parties.

§ 84.626 Chemical Agent Permeation and Penetration Resistance Against Distilled Mustard (HD) and Sarin (GB) Agent Test Requirement for CBRN Use.
The CC-SCBA model, including all components and accessories, shall resist the permeation and penetration of distilled sulfur mustard (HD) and Sarin (GB) chemical agents by meeting the requirements and test conditions specified in Table 8 for HD and Table 9 for GB.

Table 8—Test Parameters Simultaneous Liquid and Vapor Challenge of SCBA with Distilled

(1) Vapor challenge generation shall start immediately after the liquid drops have been applied and the test chamber has been sealed.
(2) The test period begins upon the start of initial vapor generation.
(3) Three consecutive sequential test data points at or exceeding 0.6 mg/m² shall collectively constitute a failure where each test value is based on a detector sample time of approximately 2 minutes.
(4) The cumulative Ct, including all peak data points, shall not be exceeded for the duration of the 90-minute test.
(5) The cumulative Ct, including all peak data points, shall not be exceeded for the duration of the 90-minute test.
(6) Breathing machine airflow rate shall be equal to or greater than 0.6 mg/m².
(7) Maximum peak excursion shall be equal to or greater than 0.6 mg/m².
(8) Absolute value with the air parameters being the following: Temperature = 32°C ± 1°C (89.6°F ± 1.8°F), Atmospheric Pressure At Sea Level = 760 mm Hg and saturation = 100%.

(1) The vapor challenge generation shall be initiated immediately after test chamber has been sealed.
(2) The test period begins upon the start of initial vapor concentration.
(3) Three consecutive sequential test data points at or exceeding 0.007 mg/m³ shall collectively constitute a failure where each test value is based on a detector sample time of approximately 2 minutes.
(4) The cumulative Ct, including all peak data points, shall not be exceeded for the duration of the 90-minute test.
(5) Breathing machine airflow rate shall be equal to or greater than 0.007 mg/m³.
(6) Absolute value with the air parameters being the following: Temperature = 32°C ± 1°C (89.6°F ± 1.8°F), Atmospheric Pressure At Sea Level = 760 mm Hg and saturation = 100%.

Firefighter Protection Requirements

§ 84.527 Firefighter Protection Requirements for CBRN Use (Optional and in addition to Section § 84.524 through § 84.526 of Subpart Q).
A NIOSH prohibition exists, as stated in Federal Register (50 FR 47456), for entry into high radiant heat and open flame environments while wearing a pure oxygen, positive-pressure CC-SCBA. However, optional testing may be obtained. In the event that this prohibition is lifted sometime in the future, approval could then be granted without additional testing. Sections § 84.524 through § 84.531 specify minimum requirements to ensure that the CC-SCBA possesses some features of high radiant heat and open flame resistance characteristics. These requirements are not meant to sanction its use in high radiant heat and open flame environments unless NIOSH repeals the prohibition.

§ 84.528 Heat and Flame Resistance Performance Requirement.
(a) The CC-SCBA and its accessories shall meet the following requirements when tested in accordance with Section 8.11 of NFPA 1981-2007 Edition with modifications made to the test apparatus and procedure to accommodate a CC-SCBA:
(1) The peak exhalation pressure shall be ≤ 200 mm H₂O and the peak inhalation pressure ≥ 0 mm, H₂O when measured as described in § 84.517(a).
(2) The components of either the SCBA or its accessories shall have an after-flame greater than 2.2 seconds.
(3) The components of either the CC-SCBA or its accessories shall not separate or fail in such a manner that would cause the CC-SCBA to be worn and used in a position not specified by the apparatus' User Instructions.
(4) The facemask lens shall not obscure vision below the 20/100 vision criteria.
(5) The CC-SCBA remaining capacity indicators shall meet the performance requirements in § 84.511.
(b) As described in § 84.525(b), NIOSH will make the determination whether to review the Edition of NFPA 1981 to test the performance requirement stated § 84.528(a).

§ 84.529 Fabric Flame Resistance Requirement.
(a) All apparatus fabric used to secure the CC-SCBA to the wearer shall meet the performance requirement of Section 7.4 of NFPA 1981-2007 Edition.
(b) As described in § 84.525(b), NIOSH will make the determination whether to review the Edition of NFPA 1981 to test the performance requirement stated § 84.529(a).

§ 84.530 Fabric Heat Resistance Requirement.
(b) As described in § 84.525(b), NIOSH will make the determination whether to review the Edition of NFPA 1981 to test the performance requirement stated § 84.530(a).

§ 84.531 Thread Heat Resistance Requirement.
(a) All thread used in the CC-SCBA shall meet the performance requirement of Section 7.6 of NFPA 1981-2007 Edition.
(b) As described in § 84.525(b), NIOSH will make the determination whether to review the Edition of NFPA 1981 to test the performance requirement stated § 84.531(a).
(5) NIOSH Oxygen (O₂) Prohibition

Timothy R. Rehak

Existing Prohibition

Available information does not demonstrate to the satisfaction of NIOSH that positive-pressure closed-circuit self-contained breathing apparatus (CC-SCBA) which use a breathing gas of pure oxygen can be used during direct exposure to open flames and/or high radiant heat and assure the wearer’s safety. Therefore, NIOSH has determined that until it has been demonstrated to the satisfaction of NIOSH that those devices can be worn under such conditions, it is prudent to presently limit the use of positive-pressure closed-circuit self-contained breathing apparatus which use pure oxygen breathing gas to atmospheres which do not involve exposure to open flames or high radiant heat.

Partners

NIOSH, NFPA, IAFF, IAFC, MSHA, and Manufacturers.

Stakeholders

User groups and manufacturing organizations including UMWLA, IAFF, IAFC, BCEA, NMA, and USWA

Proposed Fire Resistant Protection for Closed-Circuit Self-Contained Breathing Apparatus

Include optional Heat and Flame Resistance Protection performance requirements:

• Operational performance of the apparatus when exposed to the high heat and open flame test specified in Section 8.11 of NFPA 1851:2007.

Other heat and flame resistance performance requirements includes the following:

• Fabric flame resistance
• Fabric heat resistance
• Thread heat resistance

NIST Research

Objective - to develop a computational fluid dynamics (CFD) simulation of the outward leakage of oxygen around the facepiece of a closed circuit breathing device.

Conclusions

• Oxygen expelled through leak in respirator is propelled away from head region through advection and dissipates through diffusion.

• Risk of flammable mixture near head is observed in 10% propane environment.
  • This is an extreme environment (fuel-rich, near flammable mixture).

• In case of flammable environment, oxygen leak results in small fuel-lean region near head.

• In fuel-lean environment, oxygen further decreases fuel concentration.

Heat and Flame Testing Conducted

Intertek, June 2005

Treatment - Section 8.11.5 of NFPA 1851, 2002 Edition (tested without live oxygen).

Problems noted:
• After flame beyond 2.2 seconds:
  • Hose
  • Harness
  • Facepiece hose connector
  • Hole burnt through the hose.
  • Hose burnt through the facepiece hose connector.
  • Backpack fell off the mannequin
  • Bypass valve was fused shut
  • Oxygen bottle strap was burnt through.

Note: Taped CC-SCBA were not hardened for the heat or flame test.

Automated Breathing and Metabolic Simulator (ABMS) Testing after retrofitting – no difference from untreated units.

Dekra Exam, July 2007

Treatment - Department 8 of the Association for the Promotion of German Fire Safety, Guideline 9902 (tested with oxygen).

Problems noted:
• None – met requirements of EN137, Section 6.11.2.2, Flame Engulfment
  • Note: CC-SCBA were hardened for the heat and flame test.

Intertek, March 2008

Treatment - Section 8.11.5 of NFPA 1851, 2007 Edition (tested with live oxygen).

Problems noted:
• One unit had a small flame on the lower left side of the facepiece. This caused a leak into the mask, which engulfed the unit eventually into flames during the post test airflow.
• Second unit had a slight after flame after 2.2 seconds. Follow-up test on an ABMS revealed no difference from untreated units.

Expected Outputs

• Data to support the reevaluation of the current Prohibition.

Expected Outcomes

Maintain or revise policy on the use of positive-pressure closed-circuit self-contained breathing apparatus which use pure oxygen breathing gas when exposed to open flames or high radiant heat atmospheres.

Disclaimer: The findings and conclusions in this poster have not been formally disseminated by the National Institute for Occupational Safety and Health and should not be construed to represent any agency determination or policy.

(6) CC-SCBA - Standard Test Procedures

W. P. King

Goal

For Proposed Subpart Q, ensure up-to-date standard test procedures (STPs) are available for new, revised and current (continued) performance requirements for closed-circuit breathing apparatus (CC-SCBA). STP development includes:

- Incorporating state-of-the-art technology into performance requirement testing
- Benchmarking new procedures
- Elimination of tests for obsolete requirements

CDC Workplace Safety and Health

NPPTL Research to Practice through Partnership
Supplied-Air Respirator (SAR) Program
Jeffrey D. Palcic

Goal
Develop new performance requirements for the SAR and promulgate them as regulations into 42 CFR Part 84 which includes the following:

- Revise and update minimum requirements used to determine the effectiveness of SAR during entry into and escape from atmospheres not Immediately Dangerous to Life or Health (non-IDLH)
- Base on latest creditable human physiological factor limits and ergonomics
- Allow the latest technology and innovative designs to be tested and have sufficient flexibility to accommodate future technology
- Ensure that NIOSH certified SAR provide adequate protection to the wearer and operate safely
- Incorporate into the standard test procedures (STPs) the required use of test equipment that employs state of the art technology to test the performance requirements
- Develop minimum requirements to determine the effectiveness of combination SAR/self-contained breathing apparatus (SCBA) used for escape from chemical, biological, radiological, and nuclear (CBRN) (optional requirements) atmospheres that are Immediately Dangerous to Life or Health (IDLH)

Stakeholders
OSHA, Resperator Manufacturers, Employers, Labor Unions, Respirator Users

Milestones
3QFY08 Post draft SAR requirements to the NIOSH website
4QFY08 Present the new SAR requirements at public meeting
4QFY08 Post the revised draft of SAR requirements to NIOSH website

Expected Outputs
- Update requirements to align with current technology
- Update STPs and standard operating procedures (SOP) for current, new, and CBRN requirements
- Facilitate development of a greater variety of SAR designs
- CBRN Certified SAR
- Publish final rule in 42 CFR Part 84, Subpart J

Expected Outcomes
- Improve SAR performance for general industrial workers, and emergency responders
- Availability of SAR for use in CBRN environments

Partners
U.S. Army RDECOM, Respirator Manufacturers, and OSHA

Poster Topic Sequence
The following topics are covered in the remaining SAR posters. The posters are displayed in the order that they are discussed in the draft SAR standard of July 1, 2008:

Supplied-Air Respirators (SAR) Base Requirements
1. Descriptions of Airline and Airsource Respiratory Systems
2. Non-Respiratory Requirements
3. Respiratory Requirements
4. Airsource Portable Bower/Air Compressors and Air Supply Hose

Supplied-Air Respirators (SAR) Enhanced Requirements
5. Combination SAR/SCBA Requirements
6. Chemical, Biological, Radiological, and Nuclear (CBRN) Requirements

Supplied-Air Respirators (SAR) Reference Posters
7. Work Rate and Escape Cylinder Capacity
8. Standard Test Procedures

Disclaimer: The findings and conclusions in this poster have not been formally disseminated by the National Institute for Occupational Safety and Health, and should not be construed to represent any agency determination or policy.
(1) SAR Base Requirements
Descriptions of Airline and Airsource Respiratory Systems
William Hoffman

Airline System

Supplied-Air Respirator - Airline: A respirator equipped with a pressurized air hose which is used for entry into atmospheres not immediately dangerous to life or health, which utilizes a source of respirable breathing air and consists of an Airline hose, detachable coupling(s), control valve, orifice pressure demand valve, an arrangement for attaching the hose to the wearer, and a respiratory inlet covering usually consisting of a tight facepiece, loose hood, or helmet.

Airsource System

Supplied-Air Respirator - Airsource: SAR, for entry into atmospheres not immediately dangerous to life or health, which requires a portable blower/air compressor, air hose, detachable coupling(s), an arrangement for attaching the hose to the wearer and respiratory inlet covering usually consisting of a facepiece, hood, or helmet. Systems capable of supplying respirable air to four or more users are considered "industrial plant or site-wide systems" and are not within the scope of this subpart.

Supplied-air respirator-Airline with Shield: An Airline respirator equipped with additional accessories designed to protect the wearer's head and neck against impact and abrasion from rebounding abrasive particulate or toxic material, and with shielding material such as plastic, glass, woven wire, sheet metal, or other suitable resistant material to protect the lenses of respiratory inlet coverings which do not unduly interfere with the wearer's breathing zone or vision while permitting easy access to the external surface of such lenses for cleaning.

Supplied-air respirator-Airsource with Shield: An Airsource SAR equipped with additional accessories designed to protect the wearer's head and neck against impact and abrasion from rebounding abrasive particulate and toxic material. Designed with shielding material such as plastic, glass, woven wire, sheet metal, or other suitable material to protect respiratory inlet covering lens which does not unduly interfere with the wearer's breathing zone or vision while permitting easy access to the external surface of such lenses for cleaning.

Disclaimer: The findings and conclusions in this poster have not been formally disseminated by the National Institute for Occupational Safety and Health, and should not be construed to represent any agency determination or policy.
(2) SAR Base Requirements
Non-Respiratory Requirements
Jeffrey D. Palcic

For Use in Industrial Non-IDLH Atmospheres

**Required Components**
- Airline SAR – Respiratory inlet covering, air supply valve or orifice, air supply hose, detachable couplings, flexible breathing tube, and harness
- Airsource SAR – Respiratory inlet covering, air supply valve or orifice, air supply hose, detachable couplings, flexible breathing tube, harness, and portable blower or air compressor

**Respiratory Inlet Covering Requirements**
Remain unchanged from 42 CFR Part 84, Section 84.132, and 84.135 with the following exceptions:
- Helmets shall meet the requirements of ANSI Z88.1-2003 Type I or Type II protective cap standards. Head gear not designed to provide head protection shall be prominently labeled to indicate that they are not impact and penetration resistant
- Neck seal designs shall provide a seal around the neck without causing discomfort to the user and permit easy donning and doffing

**Visors/Lenses of Respiratory Inlet Coverings**
Remain unchanged from 42 CFR Part 84, Section 84.136 with the following exceptions:
- Respiratory inlet coverings shall obtain an average Visual Field Score of 90 or greater following the VFS method described by the American Medical Association (AMA)
- Lenses shall be designed to be impact and penetration resistant per the requirements of ANSI Z87.1-2003

**Noise Levels**
- Noise levels generated by the respirator during normal operation shall be measured at maximum airflow obtainable within pressure and hose length requirements and shall be less than 80 dBA at both ear canals

**Failure Mode Effects Analysis (FMEA)**
- Manufacturer shall demonstrate that reliability is assessed and controlled within their quality assurance plan by conducting a system FMEA on their device or component
- Manufacturer shall provide a written declaration that the FMEA was completed
- Manufacturer shall maintain a copy of the FMEA in their records

**General Construction**
Must meet subpart G of 42 CFR Part 84

**Harness; Minimum Requirements**
**Body Harness**
- Must hold the components of the respirator in position against wearer's body
- Designed for easy removal and replacement of respirator parts and hold the facepiece in the ready position when not in use
- Protect the pressure reducer
- Ergonomically designed for multiple shapes and sizes of users
- Shoulder strap test increased from 250 lb to 300 lb for 30 minutes
- Belt and rings increased from 300 lb to 500 lb for 30 minutes
- Life lines or safety harness shall meet applicable standards
- Hose pull test remains unchanged; 250 lb for 30 minutes
- Maximum length and diameter (heaviest hose configuration) must be dragged over a concrete floor without compromising the harness or exiting a pull of the respiratory inlet covering

**Head Harness**
- Head harness shall be adjustable, replaceable, and provide adequate tension during use
- Rigid head covering shall be required to assist in holding the covering in place

Disclaimer: The findings and conclusions in the poster have not been formally disseminated by the National Institute for Occupational Safety and Health, and should not be construed to represent any agency determination or policy.
(3) SAR Base Requirements
Respiratory Requirements
Gary Walbert

For Use in Industrial Non-IDLH Atmospheres

Continuous Flow Class
Unchanged from 42 CFR Part 84, Section 84.148

Pressure Demand Class
Unchanged from 42 CFR Part 84, Section 84.149

Demand Class
Eliminated

Breathing Air for Airline SAR
Breathing air supply shall meet the applicable minimum grade requirements for Type I-Grade D breathing air set forth in the Compressed Gas Association Commodity Specification for Air, G-7.1. 5th Edition, 2004 (Grade D or higher quality)

Breathing Air for Airsource SAR
- Blowers/air compressors for Airsource SAR shall be equipped with a CO alarm to warn the user if the CO concentration in the air supply is ≥ 10 ppm of CO
- The temperature of the air produced by the blower/air compressor for all Airsource respirators shall not exceed 6 degrees Celsius above ambient as measured at the air entrance point of the respiratory inlet covering
- Must maintain positive pressure in the breathing zone of the respiratory inlet covering(s) at the manufacturer's specified work rate(s)
- Airsource SAR shall be equipped with a filter between the portable blower/air compressor and the respiratory inlet covering(s) to effectively remove 95% of the particles from the breathing air
- The filter between the blower/air compressor and the respiratory inlet covering shall be easily replaceable by the user. The manufacturer's filter change-out schedule should be followed
- Compressors used to supply breathing air to respirators are constructed and situated to meet the requirements set forth in the 29 CFR 1910.134: 'Breathing air quality and use'

Inhalation and Exhalation Valves
Unchanged from 42 CFR Part 84, Section 84.137

Exhalation Valve Leakage
Valve and valve seats will continue to be subject to a suction of 25 mm water column but the allowable leakage between the valve and valve seat has been lowered from 30 ml to 15 ml per minute

Breathing Resistance
Inhalation and exhalation resistance shall be measured inside the respiratory inlet coverings in the breathing zone

Breathing Rates, Low, Moderate, and/or High Rates
Refer to poster "Supplied-Air Respirator (SAR) Work Rate and Escape Cylinder Capacity"

Carbon Dioxide Machine Test
Verification that inhalation carbon dioxide concentration in the breathing zone of the SAR does not exceed one percent when properly mounted on a headform connected to a breathing machine

Human Subject Testing
Upon successful completion of the carbon dioxide machine test human testing may be conducted in order to ensure that users are not exposed to elevated levels of carbon dioxide or a deficiency of oxygen. This would consist of monitoring carbon dioxide and oxygen concentrations in the breathing zone of test subjects while standing and while walking at 3.3 miles per hour. Carbon dioxide shall not exceed two percent and oxygen shall not fall below 15.5 percent

Laboratory Respiratory Protection Level (LRPL)
 Shall be determined with the respirator operating in the candidate approved design mode as described in the applicable user instructions at the manufacturer's specified work rate. The minimum LRPL values are in the following table:

<table>
<thead>
<tr>
<th>Respiratory Inlet Covering</th>
<th>LRPL - Minimum Value</th>

(4) SAR Base Requirements
Airsource Portable Blowers/Air Compressors and Air Supply Hose
William Hoffman

Airsource Portable Blower/Air Compressor

Shall be designed and constructed to maintain positive pressure in the breathing zone of the respiratory inlet covering(s) at the manufacturer's specified work rate(s).

Shall undergo a performance evaluation by operation at their specified running parameters for 8 hours a day for a total of 15 days in the most demanding configuration for which the device is to be approved. This testing will be conducted in a laboratory with the maximum number of respirators mounted on head forms and coupled to breathing machines set at the manufacturer's maximum approved work rate.

Noise levels shall be ≤ 85 dBA at any point within a three-foot diameter of the system.

Any system component exceeding 60 degrees Celsius shall be protected against incidental user contact.

Multiple user systems, whereby more than one user is supplied by a single portable blower/air compressor, may be approved, if each hose line is connected directly to a manifold (requires pressure gauge and regulator) at the blower/air compressor.

Multiple user systems shall be designed such that air shall not back flow from one line to another.

Multiple user systems shall be designed such that air in each line shall flow properly regardless of occurrences in other lines (such as total blockage or disconnected free flow).

Air Supply Hose

All air supply hose length restrictions have been eliminated and the hose lengths will be specified by the manufacturers. The system must maintain positive pressure in the respiratory inlet covering. The following requirements are based on the current 42 CFR Part 84, Table 8.

Airline Supply Hose
Air flow - shall maintain positive pressure in the respiratory inlet covering at the manufacturer's specified work rate(s) through the maximum length of hose and greatest number of connections for which approval is sought and the minimum specified air supply pressure.

Air-Regulating - unchanged with the exception that the tests will be conducted at the manufacturer's specified work rate and shall maintain positive pressure in the respiratory inlet covering.

Airsource Supply Hose
Air flow - Using the blower/air compressor as the supply, the air supply hose shall maintain positive pressure in the respiratory inlet covering at the manufacturer's specified work rate(s) through the maximum length of hose and greatest number of connections for which approval is sought and the minimum specified air supply pressure.

Airline and Airsource Supply Hose
Non-collapsibility - unchanged with the exception that the tests will be conducted at the manufacturer's specified work rate and shall maintain positive pressure in the respiratory inlet covering.

Non-kinkability - unchanged with the exception that the tests will be conducted at the manufacturer's specified work rate and shall maintain positive pressure in the respiratory inlet covering.

Strength of hose and couplings - unchanged.

Tightness - unchanged.

Hose permeation - unchanged for gasoline; additional proposed permeation tests using kerosene and toluene.

Detachable coupling - unchanged with the exception that all couplings shall be constructed to prevent unintentional disconnection requiring at least two different motions for disconnection.

Disclaimer: The findings and conclusions in the poster have not been formally disseminated by the National Institute for Occupational Safety and Health, and should not be construed to represent any agency determination or policy.
Airline and/or Airsource SAR with integrated escape cylinder

Includes all completely assembled respirators with an integrated escape breathing gas cylinder and accessories meeting the following requirements:

- Tight fitting respiratory inlet coverings offer positive pressure, pressure demand protection designed to seal to the face or neck.
- Incorporation of a 5 minute or longer duration escape air cylinder based on the high work rate, with air hose supply used during entry.
- Incorporation of a 15 minute or longer duration escape air cylinder based on the high work rate, allowing not more than 20 percent of the rated cylinder capacity of air supply to be used during entry into a hazardous area.
- If the connection to air supply hose occurs in a hazardous atmosphere zero dead volume connectors must be used.
- The connection between the air hose and the rest of the respirator, including the escape cylinder shall incorporate a check valve or other means such as no contaminated air shall reach the wearer in the event of disconnection, severing, or damage to the air hose and no back flow of the cylinder air through the disconnected air supply hose shall occur.
- The connection between the air hose and the rest of the respirator shall be such that breathing air from the cylinder shall only flow to the tight fitting respiratory inlet covering and shall not flow back through the supply air hose or pneumatic foot control connection if so equipped.
- The unit must automatically switch to the escape cylinder if the air supply hose is disconnected, severed, catastrophically fails or cannot supply adequate breathing air.
- Supplied breathing air will be disconnected and the respirator will automatically switch to the available SCBA integrated breathing air cylinder source in the event of loss of air hose supplied air. This shall occur without loss of air pressure to the user and with no detectable inward leakage of contaminants.
- An alarm providing an indication that the system is on cylinder air shall be readily visible (via light) or detectable (via sound or vibration) to the user without manipulation of the respirator and without affecting protection and performance.
- These respirators must also meet the applicable criteria for subpart H-SCBA.

Lens material haze, luminous transmittance and abrasion resistance

- Lens Material Haze: The haze value of the primary lens material shall be 3% or less when tested in accordance with ASTM D 1003-00.
- Lens material luminous transmittance: The luminous transmittance value of the primary lens material shall be 85% or greater when tested in accordance with ASTM D 1003-00.
- Lens material abrasion resistance: The haze and luminous transmittance of the primary lens material shall be determined in accordance with ASTM D 1003-00, before and after subjecting the lens material to the abrasion test. The abrasion test shall be conducted in accordance with ASTM D 1044-99 using a CS10F calibrating wheel at a minimum of 70 revolutions under a 500 gram weight. After the residue is removed from the test specimen, the test specimen shall not exhibit an increase in haze greater than 4% and a decrease in luminous transmittance greater than 4%.

Impact and penetration resistance

- All lenses of respiratory inlet covering shall be designed and constructed to be impact and penetration resistant per the requirements of ANSI Z87.1-2003, American National Standard for Occupational and Educational Personal Eye and Face Protection Devices.

Low temperature fogging

- The respirator shall demonstrate an average Visual Acuity Score (VAS) of greater or equal to 75 points for all measurements of acuity. The respirator shall be cold soaked and tested in an environmental chamber at minus 21°C or lower if requested by the manufacturer for four (4) hours. The wearer shall not experience undue discomfort because of restrictions to breathing or other physical or material changes to the respirator fitted with accessories.

Communications

- Communications are based upon performance using a modified rhyme test (MRT). The communications requirement is met if the overall performance rating is greater than or equal to seventy (70) percent. The MRT shall be performed with a steady background noise of 60 dBA consisting of a broadband "pink" noise. The distance between the listeners and speakers shall be 3 meters (9.8 feet).

(6) SAR Enhanced Requirements
Chemical, Biological, Radiological, and Nuclear (CBRN)
Tim Rehak

Performance Requirements Beyond Base and SAR/SCBA for use in CBRN Atmospheres

Airline and/or Airsource CBRN SAR/SCBA
Includes all completely assembled respirators with an integrated escape cylinder, meeting the following requirements:

- Tight fitting respiratory inlet coverings offer positive pressure, pressure demand protection
- 15 minute or longer duration escape air cylinder based on high work rate
- Connection of the SAR portion of the CBRN SAR/SCBA to the portable Airsource or Airline must occur in the non-contaminated atmosphere prior to entry
- No half-mask SAR shall be approved for CBRN protection
- Must meet criteria for subpart H: SCBA and those for CBRN SAR/SCBA in this subpart

Chemical Agent Permeation and Penetration Resistance
Chemical agent permeation and penetration resistance against sulfur mustard (HD) and sarin (GB) requirements:

- Includes all respirator components and accessories
- Test on an upper torso manikin connected to a breathing machine operating at an air flow rate of 40 Lpm, 36 respirations per minute, and 1.1 liter tidal volume
- Respirator tested in normal operating mode with the CBRN SAR/SCBA breathing from the air supply hose for a minimum of six hours
- Breathing air from the air supply hose will be terminated and the SAR must switch automatically to the escape air cylinder

Simultaneous liquid and vapor challenge of CBRN SAR/SCBA with HD

</table>

(1) Vapor challenge concentration shall start immediately after the liquid crops have been applied and the test chamber has been sealed.
(2) The test period begins upon start of initial vapor generation.
(3) Three consecutive test data points at or exceeding 0.6 mg/m³ shall collectively constitute a failure where each test value is based on a detector sample time of approximately 2 minutes.
(4) The cumulative Cₜ including all peak data points must not be exceeded for the duration of the 6-hour test.

Conditioning Requirements
CBRN SAR/SCBA and the required components shall be subject to environmental conditioning prior to testing in the manufacturer specified minimum packaging configuration as per the following table:

Multiple Work Rate Approvals

NIOSH has tentatively defined low, moderate and high work rates as described in the table below. These designations are not meant to imply that they cover the full range of human physiological limits. They represent three sustainable work rates. Table #1 includes average tidal volumes and respiration rates that NIOSH will use for positive pressure tests using a breathing machine.

<table>
<thead>
<tr>
<th>Work Rate</th>
<th>Minute Volume</th>
<th>Tidal Volume and Respiration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low</td>
<td>25 Lpm</td>
<td>1.20 liters @ 19.2 respiration per minute</td>
</tr>
<tr>
<td>Moderate</td>
<td>40 Lpm</td>
<td>1.67 liters @ 24 respiration per minute</td>
</tr>
<tr>
<td>High</td>
<td>57 Lpm</td>
<td>1.98 liters @ 29.1 respiration per minute</td>
</tr>
</tbody>
</table>

The manufacturer shall specify the highest work rate from Table #1 for the intended use of the SAR system. During testing, the SAR must maintain positive pressure in the breathing zone of the respiratory inlet covering while properly mounted on a headform coupled with a breathing machine operating at the specified work rate. The SAR must be operated at the manufacturer's minimum supply pressure and maximum hose resistance configuration at each of the rates desired for approval.

Escape Cylinder Capacity Comparison

The current version of the Draft SAR Standard allows optional approval for an enhanced SAR with integrated escape cylinder. In addition to meeting all base requirements, this enhanced SAR/SCBA must meet additional requirements to ensure safe escape from hazardous atmospheres. For escape only, the manufacturer may choose a five minute or longer duration cylinder capacity based on the high work rate (57Lpm) shown to the left. For systems to be used for both entry and escape, the manufacturer may choose a 15 minute or longer duration cylinder based on the same high work rate. No more than 20 percent of the air supply should be used for entry into the hazardous area. NIOSH is considering amending these capacity designations from cylinder duration to actual volume. This does not change the actual requirement, only the capacity designations. Table #2 describes currently proposed time designations and their volumetric equivalents.

<table>
<thead>
<tr>
<th>Capacity Designation</th>
<th>Capacity</th>
<th>Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Basis (min)</td>
<td>Escape Only</td>
<td>Entry and Escape</td>
</tr>
<tr>

<td>10</td>
<td>&gt;10*</td>
</tr>
<tr>
<td>15</td>
<td>&gt;15*</td>
<td>15</td>
</tr>
<tr>
<td>Volume Basis (liter)</td>
<td>285</td>
<td>570</td>
</tr>
<tr>
<td></td>
<td>&gt;570*</td>
<td>875</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&gt;875*</td>
</tr>
</tbody>
</table>

*Actual capacity specified by manufacturer

The purpose of the proposed change in capacity designation is to prevent confusion among end users. Specification of an exact time could lead to over estimation of the remaining air supply in cases of high exertion. A knowledge of the quantity of air available and the factors that affect the rate of consumption should give a trained user the best tools to pace activities and escape from a hazardous atmosphere in a timely fashion.
Goal

Update standard test procedures (STPs) and standard operating procedures (SOP) to reflect current, new, and CBRN performance requirements for supplied-air respirators (SAR).

New Standard Test Procedures

The following standard test procedures will be added to fulfill the testing requirements for the SAR. Several of these procedures already exist for testing other respiratory protective devices and will be modified to meet the SAR performance standards. The remainder will be developed and validated.
