Project Purpose / Objective

• **Purpose of Simulant Permeation Study:**
Through research and testing, identify chemical compounds to simulate the penetration and permeation effects of CWA (GB and HD) through barrier materials.

• **Objective:**
Identify simulants and laboratory procedures that can be used by manufacturers for estimating CWA permeation through barrier materials used to manufacture respirators.
**Goal:** Low cost, rapid, simulant screening method for determining agent barrier performance.

**Approach:**

1) Develop an inexpensive permeation system with a new cell design for testing both hard and soft materials up to at least 1 cm thick.

2) Select relatively nontoxic simulants for HD and GB based on solubility in standard polymers.

3) Employ permeation of agents and selected simulants to develop criteria for predicting resistance to agent penetration.
Permeation Cell Photographs
The Selection of Elastomeric Barrier Materials

Permeation and immersion testing was conducted on seven reinforced, cured elastomer compounds known to span a wide range in barrier properties. Three were chosen as standard materials for comparative testing with CWA (HD, GB) and simulants. The test materials with specimen thickness selected for convenient breakthrough time are:

- Butyl Rubber: 12 mil
- EPDM: 30 mil
- Silicone Rubber: 125 mil
Permeability (P) of Organic Molecules in Polymers via Solution - Diffusion

\[ P = D \cdot S \cdot L^{-1} \]

For each polymer at a specified temperature:

Diffusion Coefficient (D) = f(molecular size, concentration)

Equilibrium Solubility (S) = f(chemical interaction, concentration)

Specimen Thickness = L

Simulants which are of comparable molecular size and have a solubility similar to that of agents in the materials of interest will provide the most reliable prediction of agent permeation.
Liquid Simulant Candidates

**HD Simulants**
- DCH* - 1,6-Dichlorohexane
- DBSS – Di-n-butyl disulfide
- BCBE – Bis 4-chlorobutyl ether
- CEPS* - 2-Chloroethyl phenyl sulfide
- CECS - 2-Chloroethyl cyclohexyl sulfide
- DBS - Dibutyl sulfide

**GB Simulants**
- DMMP – Dimethyl methylphosphonate
- DEMP* – Diethyl methylphosphonate
- DEEP – Diethyl ethylphosphonate
- DIMP* - Diisopropyl methylphosphonate
- TEP – Triethyl phosphate

* selected permeants

Accomplishments and Current Status

Accomplishments:
1. Developed Permeation Test Method
2. Designed Convenient Permeation Cell
3. Correlated Permeation of CWA and Simulants
4. Recommended Criteria for Evaluating Barrier Properties Using Simulants

Status: Convenient Method Available for Testing with Simulants or Toxic Liquids
Benefits of Simulant Permeation Study:

1. Provides basis for determining suitable simulants for evaluating materials of construction.

2. Assists manufacturers in selection of barrier materials based on scientific information, reducing product development time and cost.

3. Expedites availability of new respirators and materials technology for the users.
Summary/Conclusion

- Identified simulants and a rapid, relatively low cost laboratory procedure that can be used by manufacturers for estimating CWA permeation through barrier materials.

- Wrote a draft NIOSH Guidance Document that describes test procedures, and results of agent and simulant permeation tests.

- NIOSH or SBCCOM do not guarantee that simulants identified will be suitable for all materials, nor does passage of manufacturer's pretest with a simulant guarantee passage of the official NIOSH certification testing.
