Occupational Health Guideline for Isobutyl Acetate

INTRODUCTION

This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION

- Formula: CH₃COOCH₂CH(CH₃)₂
- Synonyms: 2-Methylpropyl acetate; beta-methylpropyl ethanoate; acetic acid isobutyl ester
- Appearance and odor: Clear, colorless liquid with a pleasant, fruity odor.

PERMISSIBLE EXPOSURE LIMIT (PEL)

The current OSHA standard for isobutyl acetate is 150 parts of isobutyl acetate per million parts of air (ppm) averaged over an eight-hour work shift. This may also be expressed as 700 milligrams of isobutyl acetate per cubic meter of air (mg/m³).

HEALTH HAZARD INFORMATION

- Routes of exposure
  Isobutyl acetate can affect the body if it is inhaled, comes in contact with the eyes or skin, or is swallowed.
- Effects of overexposure
  1. Short-term Exposure: Overexposure to isobutyl acetate may cause irritation of the eyes, nose, and throat. Severe overexposure may cause weakness, drowsiness, and unconsciousness.
  2. Long-term Exposure: Prolonged overexposure may produce irritation of the skin.
  3. Reporting Signs and Symptoms: A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to isobutyl acetate.
  - Recommended medical surveillance
    The following medical procedures should be made available to each employee who is exposed to isobutyl acetate at potentially hazardous levels:
    1. Initial Medical Screening: Employees should be screened for history of certain medical conditions (listed below) which might place the employee at increased risk from isobutyl acetate exposure.
      - Skin disease: Isobutyl acetate is a mild defatting agent and can cause dermatitis on prolonged exposure. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent.
      - Kidney disease: Although isobutyl acetate is not known as a kidney toxin in humans, the importance of this organ in the elimination of toxic substances justifies special consideration in those with possible impairment of renal function.
      - Chronic respiratory disease: In persons with impaired pulmonary function, especially those with obstructive airway diseases, the breathing of isobutyl acetate might cause exacerbation of symptoms due to its irritant properties.
      - Liver disease: Although isobutyl acetate is not known as a liver toxin in humans, the importance of this organ in the biotransformation and detoxification of foreign substances should be considered before exposing persons with impaired liver function.
    2. Periodic Medical Examination: Any employee developing the above-listed conditions should be referred for further medical examination.
- Summary of toxicology
  The principal effects of overexposure to isobutyl acetate are irritation of the eyes and nose. Narcosis occurs at high concentrations. No chronic systemic effects have been reported in humans.

CHEMICAL AND PHYSICAL PROPERTIES

- Physical data
  1. Molecular weight: 116
  2. Boiling point (760 mm Hg): 117 C (243 F)

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance with all requirements of OSHA regulations.
3. Specific gravity (water = 1): 0.87
4. Vapor density (air = 1 at boiling point of isobutyl acetate): 4.0
5. Melting point: -97 °C (-143 °F)
6. Vapor pressure at 20 °C (68 °F): 13 mm Hg
7. Solubility in water, g/100 g water at 20 °C (68 °F): 0.67
8. Evaporation rate (butyl acetate = 1): 1.5
   • Reactivity
   1. Conditions contributing to instability: Heat
   2. Incompatibilities: Contact with nitrates, strong oxidizers, strong alkalis, and strong acids may cause fires and explosions.
   3. Hazardous decomposition products: Toxic gases and vapors (such as carbon monoxide) may be released in a fire involving isobutyl acetate.
   4. Special precautions: Isobutyl acetate will dissolve a wide variety of resins and plastics.
   • Flammability
   1. Flash point: 18 °C (64 °F) (closed cup)
   2. Autoignition temperature: 421 °C (790 °F)
   3. Flammable limits in air, % by volume: Lower: 2.4; Upper: 10.5
   4. Extinguishment: Dry chemical, carbon dioxide, foam
   • Warning properties
   1. Odor Threshold: Summer and May both report an odor threshold for isobutyl acetate of 4 ppm.
   2. Eye Irritation Level: According to the Documentation of TLVs, the TLV of 150 ppm is recommended primarily to prevent irritation of eyes and respiratory passages.
   3. Evaluation of Warning Properties: Since the odor threshold of isobutyl acetate is below the permissible exposure limit, it is treated as a material with good warning properties.

MONITORING AND MEASUREMENT PROCEDURES

• General

Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee's breathing zone (air that would most nearly represent that inhaled by the employee).

• Method

Sampling and analyses may be performed by collection of isobutyl acetate vapors using an adsorption tube with subsequent desorption with carbon disulfide and gas chromatographic analysis. Also, detector tubes certified by NIOSH under 42 CFR Part 84 or other direct-reading devices calibrated to measure isobutyl acetate may be used. An analytical method for isobutyl acetate is in the NIOSH Manual of Analytical Methods, 2nd Ed., Vol. 2, 1977, available from the Government Printing Office, Washington, D.C. 20402 (GPO No. 017-033-00260-6).

RESPIRATORS

• Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.

• In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

PERSONAL PROTECTIVE EQUIPMENT

• Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent repeated or prolonged skin contact with liquid isobutyl acetate.

• Clothing wet with liquid isobutyl acetate should be placed in closed containers for storage until it can be discarded or until provision is made for the removal of isobutyl acetate from the clothing. If the clothing is to be laundered or otherwise cleaned to remove the isobutyl acetate, the person performing the operation should be informed of isobutyl acetate's hazardous properties.

• Any clothing which becomes wet with liquid isobutyl acetate should be removed immediately and not reworn until the isobutyl acetate is removed from the clothing.

• Employees should be provided with and required to use splash-proof safety goggles where liquid isobutyl acetate may contact the eyes.

SANITATION

• Skin that becomes wet with liquid isobutyl acetate should be promptly washed or showered with soap or mild detergent and water to remove any isobutyl acetate.

COMMON OPERATIONS AND CONTROLS

The following list includes some common operations in which exposure to isobutyl acetate may occur and control methods which may be effective in each case:
<table>
<thead>
<tr>
<th>Operation</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Liberation during spray application of varnishes and nitrocellulose lacquers as protective and finish coatings for wood, plastic, metal, leather, and other surfaces</td>
<td>Local exhaust ventilation; personal protective equipment</td>
</tr>
<tr>
<td>Liberation during application of varnishes and nitrocellulose lacquers as protective and finish coatings for wood, paper, metal, leather, and other surfaces by dipping, roller coating, tumbling, knifeing, or brushing</td>
<td>Local exhaust ventilation; general dilution ventilation</td>
</tr>
<tr>
<td>Liberation during oven backing of phenolic and epoxy coatings</td>
<td>General dilution ventilation</td>
</tr>
<tr>
<td>Liberation during application of nitrocellulose, cellulose acetate, cellulose acetate butyrate, and cyclized rubber adhesives by machine spraying, dipping, roller coating, tumbling, knifeing, or brushing in shoe manufacturing, book binding, packaging, leather processing, photographic film manufacturing, and paper processing</td>
<td>Local exhaust ventilation; general dilution ventilation</td>
</tr>
<tr>
<td>Use and liberation during manual application of nitrocellulose, cellulose acetate, cellulose acetate butyrate, and cyclized rubber adhesives</td>
<td>General dilution ventilation; local exhaust ventilation; personal protective equipment</td>
</tr>
<tr>
<td>Liberation during cleaning and maintenance of acetate-processing equipment, including kettles, distillation columns, and storage vessels</td>
<td>Personal protective equipment</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>Liberation during manufacture of some perfumes, cosmetics, and flavoring agents</td>
<td>General dilution ventilation</td>
</tr>
<tr>
<td>Liberation during spray application of vinyl-based primers, maintenance paints, and other industrial coatings</td>
<td>Local exhaust ventilation; personal protective equipment</td>
</tr>
</tbody>
</table>

**EMERGENCY FIRST AID PROCEDURES**

In the event of an emergency, institute first aid procedures and send for first aid or medical assistance.

- **Eye Exposure**
  If isobutyl acetate gets into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. Get medical attention as soon as possible. Contact lenses should not be worn when working with this chemical.

- **Skin Exposure**
  If isobutyl acetate gets on the skin, promptly flush the contaminated skin with water. If isobutyl acetate soaks through the clothing, remove the clothing immediately and flush the skin with water. If there is skin irritation, get medical attention.

- **Breathing**
  If a person breathes in large amounts of isobutyl acetate, move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. Keep the affected person warm and at rest. Get medical attention as soon as possible.

- **Swallowing**
  When isobutyl acetate has been swallowed, get medical attention immediately. If medical attention is not immediately available, get the afflicted person to vomit by having him touch the back of his throat with his finger or by giving him syrup of ipecac as directed on the package. This non-prescription drug is available at most drug stores and drug counters and should be kept with emergency medical supplies in the workplace. Do not make an unconscious person vomit.

- **Rescue**
  Move the affected person from the hazardous exposure. If the exposed person has been overcome, notify someone else and put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility's emergency rescue procedures and know the locations of rescue equipment before the need arises.
SPILL, LEAK, AND DISPOSAL PROCEDURES

- Persons not wearing protective equipment and clothing should be restricted from areas of spills or leaks until cleanup has been completed.
- If isobutyl acetate is spilled or leaked, the following steps should be taken:
  1. Remove all ignition sources.
  2. Ventilate area of spill or leak.
  3. For small quantities, absorb on paper towels. Evaporate in a safe place (such as a fume hood). Allow sufficient time for evaporating vapors to completely clear the hood ductwork. Burn the paper in a suitable location away from combustible materials. Large quantities can be collected and atomized in a suitable combustion chamber. Isobutyl acetate should not be allowed to enter a confined space, such as a sewer, because of the possibility of an explosion.
- Waste disposal methods:
  Isobutyl acetate may be disposed of:
  1. By absorbing it in vermiculite, dry sand, earth or a similar material and disposing in a secured sanitary landfill.
  2. By atomizing in a suitable combustion chamber.
