Occupational Health Guideline for LPG

INTRODUCTION
This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION
• Formula: C₄H₁₀ - C₅H₁₂ - C₆H₁₄ mixture
• Synonyms: Liquefied petroleum gas; bottled gas
• Appearance and odor: Colorless, odorless gas (a foul-smelling odorant is usually added).

PERMISSIBLE EXPOSURE LIMIT (PEL)
The current OSHA standard for LPG is 1000 parts of LPG per million parts of air (ppm) averaged over an eight-hour work shift. This may also be expressed as 1800 milligrams of LPG per cubic meter of air (mg/m³).

HEALTH HAZARD INFORMATION
• Routes of exposure
LPG can affect the body if it is inhaled or if it comes in contact with the eyes or skin.
• Effects of overexposure
Overexposure to LPG can cause lightheadedness and drowsiness. Greater exposure may also cause unconsciousness and death. Contact with the liquid may also cause frostbite and irritation.
• Reporting signs and symptoms
A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to LPG.
• Recommended medical surveillance
Routine medical examinations should be provided to each employee who is exposed to LPG at potentially hazardous levels.

• Summary of toxicology
LPG in gaseous form acts as a simple asphyxiant and a central nervous system depressant. In liquid form it may cause frostbite, as well as skin irritation. Toxicologic data are meager, and no chronic systemic effects have been reported from industrial exposure.

CHEMICAL AND PHYSICAL PROPERTIES
• Physical data
  1. Molecular weight: 42 — 58 depending on relative amounts of ingredients
  2. Boiling point (760 mm Hg): -40 to -0.5 C (-40 to 31 F)
  3. Specific gravity (water = 1): 0.5 to 0.58
  4. Vapor density (air = 1 at boiling point of LPG): 1.6 to 2.0
  5. Melting point: Data not available
  7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
  8. Evaporation rate (butyl acetate = 1): Much greater than 1
• Reactivity
  1. Conditions contributing to instability: Heat
  2. Incompatibilities: Contact with strong oxidizing agents may cause fires and explosions.
  3. Hazardous decomposition products: Toxic gases and vapors (such as carbon monoxide) may be released in a fire involving LPG.
  4. Special precautions: LPG will attack some forms of plastics, rubber, and coatings.
• Flammability
  1. Flash point: Not applicable (gas)
  2. Autoignition temperature: 405 to 450 C (761 to 842 F)
  3. Flammable limits in air, % by volume: Lower: 1.9; Upper: 9.5 (estimated)
  4. Extinguishant: Stop flow of gas

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance with all requirements of OSHA regulations.

Public Health Service Centers for Disease Control
National Institute for Occupational Safety and Health

U.S. DEPARTMENT OF LABOR
Occupational Safety and Health Administration
Warning properties

1. Odor Threshold: Propane is the main constituent of LPG, according to the Documentation of TLV’s. The odor threshold of propane (20,000 ppm) is 20 times the permissible exposure limit (1000 ppm).

2. Eye Irritation Level: Since propane is the main constituent of LPG, and since the eye irritation threshold of propane is above its lower flammable limit, eye irritation does not restrict respirator selection either for propane or for LPG.

3. Evaluation of Warning Properties: The odor threshold of propane is 20 times higher than its permissible exposure limit. On the basis of the judgment that propane does not have adequate warning properties, for the purposes of this guideline, LPG is also assumed not to have adequate warning properties.

MONITORING AND MEASUREMENT PROCEDURES

- General
  Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee’s breathing zone (air that would most nearly represent that inhaled by the employee).

- Method
  Sampling and analyses may be performed by utilizing a combustible gas meter. Also, detector tubes certified by NIOSH under 42 CFR Part 84 or other direct-reading devices calibrated to measure LPG may be used. An analytical method for LPG is in the NIOSH Manual of Analytical Methods, 2nd Ed., Vol. 2, 1977, available from the Government Printing Office, Washington, D.C. 20402 (GPO No. 017-033-00260-6).

RESPIRATORS

- Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.

- In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

PERSONAL PROTECTIVE EQUIPMENT

- Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent the skin from becoming frozen from contact with liquid LPG or from contact with vessels containing liquid LPG.
- Any clothing which becomes wet with liquid LPG should be removed immediately and not re-worn until the LPG has evaporated.
- Employees should be provided with and required to use splash-proof safety goggles where liquid LPG may contact the eyes.

COMMON OPERATIONS AND CONTROLS

The following list includes some common operations in which exposure to LPG may occur and control methods which may be effective in each case:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use in chemical industry as feedstock in catalytic cracking in manufacture of petrochemicals and polymers</td>
<td>General dilution ventilation</td>
</tr>
<tr>
<td>Use as an internal combustion engine fuel</td>
<td>General dilution ventilation</td>
</tr>
<tr>
<td>Use in manufacture of synthetic rubber</td>
<td>Process enclosure; general dilution ventilation</td>
</tr>
<tr>
<td>Use as a fuel for industrial space and wall heating, air conditioning, and water heating</td>
<td>General dilution ventilation</td>
</tr>
<tr>
<td>Use as a fuel for drying agricultural products; use as a low sulfur fuel for cutting, soldering, and brazing</td>
<td>General dilution ventilation</td>
</tr>
<tr>
<td>Use as a fuel to augment public supply; to increase BTU content of manufactured gas</td>
<td>General dilution ventilation</td>
</tr>
</tbody>
</table>
LEAK AND DISPOSAL PROCEDURES

- Persons not wearing protective equipment and clothing should be restricted from areas of leaks until cleanup has been completed.
- If LPG is leaked, the following steps should be taken:
  1. Remove all ignition sources.
  2. Ventilate area of leak.
  3. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair the leak or allow the cylinder to empty.
- Waste disposal method:
  LPG may be disposed of by burning at a safe location or in a suitable combustion chamber.
