Occupational Health Guideline for Methyl Cellosolve Acetate

INTRODUCTION
This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION
- Formula: CH₂COOCH₂CH₃OCH₃
- Synonyms: 2-Methoxyethyl acetate; glycol monomethyl ether acetate; ethylene glycol monomethyl ether acetate
- Appearance and odor: Colorless liquid with a mild, ether-like odor.

PERMISSIBLE EXPOSURE LIMIT (PEL)
The current OSHA standard for methyl cellosolve acetate is 25 parts of methyl cellosolve acetate per million parts of air (ppm) averaged over an eight-hour work shift. This may also be expressed as 120 milligrams of methyl cellosolve acetate per cubic meter of air (mg/m³).

HEALTH HAZARD INFORMATION
- Routes of exposure
Methyl cellosolve acetate can affect the body if it is inhaled, comes in contact with the eyes or skin, or is swallowed.
- Effects of overexposure
Swallowing a large single dose of methyl cellosolve acetate might be fatal. Swallowing repeated smaller doses of methyl cellosolve acetate or repeated breathing of high air levels of methyl cellosolve acetate might cause lung or kidney damage, brain damage, and death. It is unlikely that air levels of methyl cellosolve acetate will be dangerous unless the liquid is heated. Methyl cellosolve acetate might cause eye irritation if splashed in the eyes. Methyl cellosolve acetate can be absorbed through intact skin. If a large amount is absorbed, death may result.
- Reporting signs and symptoms
A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to methyl cellosolve acetate.
- Recommended medical surveillance
The following medical procedures should be made available to each employee who is exposed to methyl cellosolve acetate at potentially hazardous levels:
  1. Initial Medical Screening: Employees should be screened for history of certain medical conditions (listed below) which might place the employee at increased risk from methyl cellosolve acetate exposure.
     - Chronic respiratory disease: In persons with impaired pulmonary function, especially those with obstructive airway diseases, the breathing of methyl cellosolve acetate might cause exacerbation of symptoms due to its irritant properties.
     - Skin disease: Methyl cellosolve acetate is absorbed through the skin. It also is a defatting agent and may cause dryness and cracking. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent.
     - Kidney disease: Since methyl cellosolve acetate may cause kidney damage in humans, the importance of this organ in the elimination of toxic substances justifies special consideration in those with possible impairment of renal function.
     - Liver disease: Although methyl cellosolve acetate is not known as a liver toxin in humans, the importance of this organ in the biotransformation and detoxification of foreign substances should be considered before exposing persons with impaired liver function.
  2. Periodic Medical Examination: Any employee developing the above-listed conditions should be referred for further medical examination.
- Summary of toxicology
Methyl cellosolve acetate is irritating to the upper respiratory tract and is only slightly narcotic. Guinea...
pigs and cats exposed to nearly saturated vapor died after some delay; concentrations of 1500 ppm for 7 hours killed cats, while 7000 ppm for 4 hours was lethal to some rats. On repeated exposures, 500 ppm for 8 hours killed some cats. There was irritation of upper respiratory tract, disturbance of equilibrium, drowsiness, and apathy followed by death. These animals had damage to the lung and kidney. There was only slight irritation of the eyes. There was no irritation upon skin contact, but absorption did occur. No chronic systemic effects have been reported in humans.

CHEMICAL AND PHYSICAL PROPERTIES

- **Physical data**
  1. Molecular weight: 118
  2. Boiling point (760 mm Hg): 145 C (293 F)
  3. Specific gravity (water = 1): 1.01
  4. Vapor density (air = 1 at boiling point of methyl cellosolve acetate): 4.1
  5. Melting point: -65 C (-85 F)
  6. Vapor pressure at 20 C (68 F): 2 mm Hg
  7. Solubility in water, g/100 g water at 20 C (68 F):
     Completely miscible
  8. Evaporation rate (butyl acetate = 1): 0.3

- **Reactivity**
  1. Conditions contributing to instability: Heat
  2. Incompatibilities: Contact with nitrates, strong oxidizers, strong alkalies, and strong acids may cause fires and explosions.
  3. Hazardous decomposition products: Toxic gases and vapors (such as carbon monoxide) may be released in a fire involving methyl cellosolve acetate.
  4. Special precautions: None

- **Flammability**
  1. Flash point: 44 C (111 F) (closed cup)
  2. Autoignition temperature: 393 C (740 F)
  3. Flammable limits in air, % by volume: Lower: 1.7; Upper: 8.2

- **Extinguishment:** Dry chemical, alcohol foam, carbon dioxide

- **Warning properties**
  1. Odor Threshold: According to the Handbook of Organic Industrial Solvents, the odor threshold of methyl cellosolve acetate is twice the permissible exposure level.
  2. Eye Irritation Level: According to Browning, methyl cellosolve acetate is only slightly irritating to the eyes and mucous membranes. No quantitative information is available concerning what concentrations produce the irritation, however. Union Carbide reports that "five drops of undiluted chemical produced minor injury in rabbit eyes."
  3. Evaluation of Warning Properties: Since the odor threshold of methyl cellosolve acetate is only twice the permissible exposure level, it is treated as a material with good warning properties.

MONITORING AND MEASUREMENT PROCEDURES

- **General**
  Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee’s breathing zone (air that would most nearly represent that inhaled by the employee).

- **Method**
  Sampling and analyses may be performed by collection of methyl cellosolve acetate vapors using an adsorption tube with subsequent desorption with carbon disulfide and gas chromatographic analysis. Also, detector tubes certified by NIOSH under 42 CFR Part 84 or other direct-reading devices calibrated to measure methyl cellosolve acetate may be used. An analytical method for methyl cellosolve acetate is in the NIOSH Manual of Analytical Methods, 2nd Ed., Vol. 2, 1977, available from the Government Printing Office, Washington, D.C. 20402 (GPO No. 017-033-00260-6).

RESPIRATORS

- **Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.**

- **In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.**

PERSONAL PROTECTIVE EQUIPMENT

- **Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent repeated or prolonged skin contact with liquid methyl cellosolve acetate.**

- **Clothing wet with liquid methyl cellosolve acetate should be placed in closed containers for storage until it can be discarded or until provision is made for the**
removal of methyl cellosolve acetate from the clothing. If the clothing is to be laundered or otherwise cleaned to remove the methyl cellosolve acetate, the person performing the operation should be informed of methyl cellosolve acetate’s hazardous properties.
- Non-impervious clothing which becomes contaminated with liquid methyl cellosolve acetate should be removed promptly and not re-worn until the methyl cellosolve acetate is removed from the clothing.
- Employees should be provided with and required to use splash-proof safety goggles where liquid methyl cellosolve acetate may contact the eyes.

**SANITATION**

- Skin that becomes contaminated with liquid methyl cellosolve acetate should be promptly washed or showered to remove any methyl cellosolve acetate.
- Employees who handle liquid methyl cellosolve acetate should wash their hands thoroughly with soap or mild detergent and water before eating or smoking.

**COMMON OPERATIONS AND CONTROLS**

The following list includes some common operations in which exposure to methyl cellosolve acetate may occur and control methods which may be effective in each case:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use as a solvent during spray or heat applications of surface coatings, including varnishes, dopes, lacquers, metal lacquers, cellulose lacquers for paper coatings, textile printing, and leather finishes</td>
<td>Local exhaust ventilation; general dilution ventilation; personal protective equipment</td>
</tr>
<tr>
<td>Use as a solvent during spray or heat applications of adhesives, including polyvinyl formal, polyvinyl butyral, and polyvinyl acetate adhesives</td>
<td>Local exhaust ventilation; general dilution ventilation; personal protective equipment</td>
</tr>
<tr>
<td>Use in manufacture of photographic film</td>
<td>Local exhaust ventilation; general dilution ventilation; personal protective equipment</td>
</tr>
<tr>
<td>Use during dry cleaning operations</td>
<td>Local exhaust ventilation; personal protective equipment</td>
</tr>
</tbody>
</table>

**Operation**

Use as a solvent during manufacture of surface coatings, including lacquers, dopes, varnishes, nail polishes; use during manufacture of adhesives

**Controls**

Local exhaust ventilation; general dilution ventilation; personal protective equipment

**EMERGENCY FIRST AID PROCEDURES**

In the event of an emergency, institute first aid procedures and send for first aid or medical assistance.
- **Eye Exposure**
  If methyl cellosolve acetate gets into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. Get medical attention as soon as possible. Contact lenses should not be worn when working with this chemical.
- **Skin Exposure**
  If methyl cellosolve acetate gets on the skin, promptly flush the contaminated skin with water. If methyl cellosolve acetate soaks through the clothing, remove the clothing immediately and flush the skin with water. If there is skin irritation, get medical attention.
- **Breathing**
  If a person breathes in large amounts of methyl cellosolve acetate, move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. Keep the affected person warm and at rest. Get medical attention as soon as possible.
- **Swallowing**
  When methyl cellosolve acetate has been swallowed, get medical attention immediately. If medical attention is not immediately available, get the afflicted person to vomit by having him touch the back of his throat with his finger or by giving him syrup of ipecac as directed on the package. This non-prescription drug is available at most drug stores and drug counters and should be kept with emergency medical supplies in the workplace. Do not make an unconscious person vomit.
- **Rescue**
  Move the affected person from the hazardous exposure. If the exposed person has been overcome, notify someone else and put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility’s emergency rescue procedures and know the locations of rescue equipment before the need arises.

**SPILL, LEAK, AND DISPOSAL PROCEDURES**

- Persons not wearing protective equipment and clothing should be restricted from areas of spills or leaks until cleanup has been completed.
- If methyl cellosolve acetate is spilled or leaked, the following steps should be taken:
  1. Remove all ignition sources.
2. Ventilate area of spill or leak.
3. For small quantities, absorb on paper towels. Evaporate in a safe place (such as a fume hood). Allow sufficient time for evaporating vapors to completely clear the hood ductwork. Burn the paper in a suitable location away from combustible materials. Large quantities can be collected and atomized in a suitable combustion chamber. Liquid methyl cellosolve acetate should not be allowed to enter a confined space, such as a sewer, because of the possibility of an explosion.

- Waste disposal methods:
  Methyl cellosolve acetate may be disposed of:
  1. By absorbing it in vermiculite, dry sand, earth or a similar material and disposing in a secured sanitary landfill.
  2. By atomizing in a suitable combustion chamber.
