OCCUPATIONAL SAFETY AND HEALTH GUIDELINE FOR
PHENYLHYDRAZINE
POTENTIAL HUMAN CARCINOCEN

INTRODUCTION

This guideline summarizes pertinent information about phenylhydrazine for workers, employers, and occupational safety and health professionals who may need such information to conduct effective occupational safety and health programs. Recommendations may be superseded by new developments in these fields; therefore, readers are advised to regard these recommendations as general guidelines.

SUBSTANCE IDENTIFICATION

- **Formula**: C₆H₈N₂
- **Structure**: \[\text{structure diagram}\]
- **Synonyms**: Hydrazinobenzene, hydrazine-benzene
- **Identifiers**: CAS 100-63-0; RTECS MV8925000; DOT 2572, label required: "Poison"
- **Appearance and odor**: Pale yellow crystals or oily liquid with a faint aromatic odor; color darkens upon exposure to air and light

CHEMICAL AND PHYSICAL PROPERTIES

- **Physical data**
  1. Molecular weight: 108.16
  2. Boiling point (at 760 mmHg): 243.5°C (471°F) with decomposition
  3. Specific gravity (water = 1): 1.0978
  4. Vapor density (air = 1 at boiling point of phenylhydrazine): 3.7
  5. Melting point: 19.6°C (68°F)
  6. Vapor pressure at 25°C (77°F): 0.04 mmHg
  7. Slightly soluble in water
  8. Evaporation rate (butyl acetate = 1): 0.4
  9. Saturation concentration in air (approximate) at 25°C (77°F): 50 ppm
  10. Ionization potential: 7.66 eV
- **Reactivity**
  1. Incompatibilities: Phenylhydrazine is a highly reactive reducing agent, and contact with oxides of iron or copper and with manganese, lead, copper, or their alloys can lead to fires and explosions.
  2. Hazardous decomposition products: Toxic vapors and gases (e.g., oxides of nitrogen and carbon monoxide) may be released in a fire involving phenylhydrazine.
  3. Caution: Phenylhydrazine will attack cork, some forms of plastics, coatings, and rubber.

- **Flammability**
  1. Flash point: 88°C (190°F) (closed cup)
  2. Autoignition temperature: 174°C (345°F)
  3. Extinguishment: Alcohol foam, dry chemical, carbon dioxide, or large quantities of coarse water spray
  5. Caution: Phenylhydrazine may ignite spontaneously when spread on a large surface or when in air and in contact with porous materials such as soil, asbestos, wood, or cloth, or with oxidants such as hydrogen peroxide or nitric acid.

- **Warning properties**
  Evaluation of warning properties for respirator selection: Warning properties are not considered in recommending respirators for use with carcinogens.

EXPOSURE LIMITS

The current Occupational Safety and Health Administration (OSHA) permissible exposure limit (PEL) for phenylhydrazine is 5 parts of phenylhydrazine per million parts of air (ppm) [22 milligrams of phenylhydrazine per cubic meter of air (mg/m³)] as a time-weighted average (TWA) concentration over an 8-hour workshift (Skin). The notation "Skin" refers to the potential contribution to overall exposure by the cutaneous route including the mucous membranes and eyes. The National Institute for Occupational Safety and Health (NIOSH) recommends that phenylhydrazine be controlled and handled as a potential human carcinogen in the workplace and that exposure be minimized to the lowest feasible limit. The NIOSH recommended exposure limit (REL) is 0.14 ppm (0.6 mg/m³) as a ceiling concentration determined in any 120-minute sampling period. The NIOSH REL represents the lowest reliably detectable level by NIOSH-validated methods. The American Conference of Governmental Industrial Hygienists (ACGIH) has designated phenylhydrazine as an A2 substance (suspected hu-
man carcinogen) having an assigned threshold limit value (TLV®) of 5 ppm (20 mg/m³) (Skin) as a TWA for a normal 8-hour workday and a 40-hour workweek; the ACGIH short term exposure limit (STEL) is 10 ppm (45 mg/m³) (Table 1).

* (Skin): Potential contribution to overall exposure by the cutaneous route including mucous membranes and eyes.
† (Ca): NIOSH recommends treating as a potential human carcinogen.

HEALTH HAZARD INFORMATION

- Routes of exposure
Phenyldrazine may cause adverse health effects following exposure via inhalation, ingestion, or dermal or eye contact.

- Summary of toxicology
1. Effects on animals: Acute subcutaneous or intraperitoneal injection of phenyldrazine hydrochloride in mice, rats, or dogs caused deficient oxygenation of the blood (cyanosis), breathing difficulty (dyspnea), convulsions, severe hemolytic anemia, or degenerative lesions of the liver and kidneys. Subchronic oral administration of phenyldrazine to mice produced tumors of the blood vessels and cancer of the lungs. Phenyldrazine injected into pregnant rats reduced certain learning abilities in the offspring by inducing severe neonatal jaundice and anemia.
2. Effects on humans: Exposure of workers to phenyldrazine has caused hemolytic anemia.

- Signs and symptoms of exposure
1. Short-term (acute): Exposure to phenyldrazine can cause vomiting, diarrhea, fatigue, headache, and irritation and itchiness of the eyes and skin.
2. Long-term (chronic): Repeated skin contact with phenyldrazine can cause skin sensitization and eczematous dermatitis with redness, swelling, and rash.

RECOMMENDED MEDICAL PRACTICES

- Medical surveillance program
Workers with potential exposures to chemical hazards should be monitored in a systematic program of medical surveillance intended to prevent or control occupational injury and disease. The program should include education of employers and workers about work-related hazards, placement of workers in jobs that do not jeopardize their safety and health, earliest possible detection of adverse health effects, and referral of workers for diagnostic confirmation and treatment. The occurrence of disease (a “sentinel health event,” SHE) or other work-related adverse health effects should prompt immediate evaluation of primary preventive measures (e.g., industrial hygiene monitoring, engineering controls, and personal protective equipment). A medical surveillance program is intended to supplement, not replace, such measures.

A medical surveillance program should include systematic collection and epidemiologic analysis of relevant environmental and biologic monitoring, medical screening, morbidity, and mortality data. This analysis may provide information about the relatedness of adverse health effects and occupational exposure that cannot be discerned from results in individual workers. Sensitivity, specificity, and predictive values of biologic monitoring and medical screening tests should be evaluated on an industry-wide basis prior to application in any given worker group. Intrinsically to a surveillance program is the dissemination of summary data to those who need to know, including employers, occupational health professionals, potentially exposed workers, and regulatory and public health agencies.

- Preplacement medical evaluation
Prior to placing a worker in a job with a potential for exposure to phenyldrazine, the physician should evaluate and document the worker’s baseline health status with thorough medical, environmental, and occupational histories, a physical examination, and physiologic and laboratory tests appropriate for the anticipated occupational risks. These should concentrate on the function and integrity of the eyes, skin, liver, kidneys, and hematopoietic (blood-cell forming), nervous, and respiratory systems. Medical surveillance for respiratory disease should be conducted by using the principles and methods recommended by NIOSH and the American Thoracic Society (ATS). There is little information available on the risk to workers with a history of hemolytic anemia. The physician should obtain a complete blood cell count and baseline tests for red blood cell hemolysis.

A preplacement medical evaluation is recommended in order to detect and assess preexisting or concurrent conditions which may be aggravated or result in increased risk when a worker is exposed to phenyldrazine at or below the NIOSH REL. The examining physician should consider the probable frequency, intensity, and duration of exposure, as well as the nature and degree of the condition, in placing such a worker. Such conditions, which should not be regarded as absolute contraindications to job placement, include a history of chronic skin disease or concurrent dermatitis and significant breathing impairment due to preexisting chronic lung disease. In addition to the medical interview and physical examination, the means to identify respiratory conditions may include the methods recommended by NIOSH and ATS. Mild non-hemolytic anemia (e.g., mild iron-deficiency anemia) is not a contraindication for placement in a job with a potential for exposure to phenyldrazine.

- Periodic medical screening and/or biologic monitoring
Occupational health interviews and physical examinations should be performed at regular intervals. Additional examina-
tions may be necessary should a worker develop symptoms that may be attributed to exposure to phenylhydrazine. The interviews, examinations, and appropriate medical screening and/or biologic monitoring tests should be directed at identifying an excessive decrease or adverse trend in the integrity and physiologic function of the eyes, skin, liver, kidneys, and hematopoietic, nervous, and respiratory systems as compared to the baseline status of the individual worker or to expected values for a suitable reference population. The following tests should be used and interpreted according to standardized procedures and evaluation criteria recommended by NIOSH and ATS: standardized questionnaires and tests of lung function.

• **Medical practices recommended at the time of job transfer or termination**
  The medical, environmental, and occupational history interviews, the physical examination, and selected physiologic and laboratory tests which were conducted at the time of placement should be repeated at the time of job transfer or termination. Any changes in the worker’s health status should be compared to those expected for a suitable reference population. Because occupational exposure to phenylhydrazine may cause diseases of prolonged induction-latency, the need for medical surveillance may extend well beyond termination of employment.

• **Sentinel health events**
  Acute SHE's include: Contact and/or allergic dermatitis.

### MONITORING AND MEASUREMENT PROCEDURES

• **Ceiling concentration evaluation**
  Measurements to determine worker exposure should be taken during periods of maximum expected airborne concentrations of phenylhydrazine. Each measurement to determine the NIOSH REL (ceiling exposure) in the worker's breathing zone (air that most nearly represents that inhaled by the worker) should consist of a 120-minute sample or a series of consecutive samples that total 120 minutes. A minimum of three measurements should be taken during one workshift, and the highest of all measurements taken is an estimate of the worker's exposure. If the periods of maximum exposure are not clearly defined, a statistical procedure which can be used as a peak exposure detection strategy is given in the *Occupational Exposure Sampling Strategy Manual*.

• **Method**
  Sampling and analysis may be performed by collecting phenylhydrazine with tubes containing sulfuric-acid-coated silica and analyzing by gas chromatography. Direct-reading devices calibrated to measure phenylhydrazine may also be used if available. A detailed sampling and analytical method for phenylhydrazine may be found in the *NIOSH Manual of Analytical Methods* (method number 248).

### PERSONAL PROTECTIVE EQUIPMENT

Chemical protective clothing (CPC) should be selected after utilizing available performance data, consulting with the manufacturer, and then evaluating the clothing under actual use conditions.

Workers should be provided with and required to use CPC, gloves, and other appropriate protective clothing necessary to prevent skin contact with phenylhydrazine.

### SANITATION

Clothing which is contaminated with phenylhydrazine should be removed immediately and placed in sealed containers for storage until it can be discarded or until provision is made for the removal of phenylhydrazine from the clothing. If the clothing is to be laundered or cleaned, the person performing the operation should be informed of phenylhydrazine's hazardous properties. Reusable clothing and equipment should be checked for residual contamination before reuse or storage.

A change room with showers, washing facilities, and lockers that permit separation of street and work clothes should be provided.

Workers should be required to shower following a workshift and prior to putting on street clothes. Clean work clothes should be provided daily.

Skin that becomes contaminated with phenylhydrazine should be promptly washed with soap and water.

The storage, preparation, dispensing, or consumption of food or beverages, the storage or application of cosmetics, the storage or smoking of tobacco or other smoking materials, or the storage or use of products for chewing should be prohibited in work areas.

Workers who handle phenylhydrazine should wash their faces, hands, and forearms thoroughly with soap and water before eating, smoking, or using toilet facilities.

### COMMON OPERATIONS AND CONTROLS

Common operations in which exposure to phenylhydrazine may occur and control methods which may be effective in each case are listed in Table 2.

1988

Phenylhydrazine 3
EMERGENCY FIRST AID PROCEDURES

In the event of an emergency, remove the victim from further exposure, send for medical assistance, and initiate emergency procedures:

* Eye exposure
Where there is any possibility of a worker’s eyes being exposed to phenylhydrazine, an eye-wash fountain should be provided within the immediate work area for emergency use.

If phenylhydrazine gets into the eyes, flush them immediately with large amounts of water for 15 minutes, lifting the lower and upper lids occasionally. Get medical attention as soon as possible. Contact lenses should not be worn when working with this chemical.

* Skin exposure
Where there is any possibility of a worker’s body being exposed to phenylhydrazine, facilities for quick drenching of the body should be provided within the immediate work area for emergency use.

If phenylhydrazine gets on the skin, wash it immediately with soap and water. If phenylhydrazine penetrates the clothing, remove the clothing immediately and wash the skin with soap and water. Get medical attention promptly.

* Rescue
If a worker has been incapacitated, move the affected worker from the hazardous exposure. Put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility’s emergency rescue procedures and know the locations of rescue equipment before the need arises.

SPILLS AND LEAKS

Workers not wearing protective equipment and clothing should be restricted from areas of spills or leaks until cleanup has been completed.

If phenylhydrazine is spilled or leaked, the following steps should be taken:

1. Remove all ignition sources.
2. Ventilate area of spill or leak.
3. Small quantities of liquids containing phenylhydrazine may be flushed with water and collected in open holding tanks. Concentrations less than 2% can be oxidized by slowly adding 10% hydrogen peroxide, calcium hypochlorite, or household bleach.
4. Large quantities of liquids containing phenylhydrazine may be diluted with water and flushed to a safe, open area such as a catch basin. Phenylhydrazine should not be allowed to enter a confined space such as a sewer because of the possibility of an explosion.

WASTE REMOVAL AND DISPOSAL

U.S. Environmental Protection Agency, Department of Transportation, and/or state and local regulations shall be followed to assure that removal, transport, and disposal are in accordance with existing regulations.

RESPIRATORY PROTECTION

It must be stressed that the use of respirators is the least preferred method of controlling worker exposure and should not normally be used as the only means of preventing or minimizing exposure during routine operations. However, there are some exceptions for which respirators may be used to control exposure; when engineering and work practice controls are not technically feasible, when engineering controls are in the process of being installed, or during emergencies and certain maintenance operations including those requiring confined-space entry (Table 3).

In addition to respirator selection, a complete respiratory protection program should be instituted which as a minimum complies with the requirements found in the OSHA Safety and Health Standards 29 CFR 1910.134. A respiratory protection program should include as a minimum an evaluation of the worker’s ability to perform the work while wearing a respirator, the regular training of personnel, fit testing, periodic environmental monitoring, maintenance, inspection, and cleaning. The implementation of an adequate respiratory protection program, including selection of the correct respirators, requires that a knowledgeable person be in charge of the program and that the program be evaluated regularly.

Only respirators that have been approved by the Mine Safety and Health Administration (MSHA, formerly Mining Enforcement and Safety Administration) and by NIOSH should be used. Remember! Air-purifying respirators will not protect from oxygen-deficient atmospheres.
