Occupational Health Guideline for n-Propyl Acetate

INTRODUCTION

This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION

- Formula: CH₃COOCH₂CH₂CH₃
- Synonyms: Propyl acetate; acetic acid n-propyl ester
- Appearance and odor: Colorless liquid with a mild, fruity odor.

PERMISSIBLE EXPOSURE LIMIT (PEL)

The current OSHA standard for n-propyl acetate is 200 parts of n-propyl acetate per million parts of air (ppm) averaged over an eight-hour work shift. This may also be expressed as 840 milligrams of n-propyl acetate per cubic meter of air (mg/m³).

HEALTH HAZARD INFORMATION

- Routes of exposure
  n-Propyl acetate can affect the body if it is inhaled, comes in contact with the eyes or skin, or is swallowed.
- Effects of overexposure
  1. Short-term Exposure: Overexposure to n-propyl acetate may cause irritation of the eyes, nose, and throat. Severe overexposure may cause weakness, drowsiness, and unconsciousness.
  2. Long-term Exposure: Prolonged overexposure may produce irritation of the skin.
  3. Reporting Signs and Symptoms: A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to n-propyl acetate.

- Recommended medical surveillance
  The following medical procedures should be made available to each employee who is exposed to n-propyl acetate at potentially hazardous levels:
  1. Initial Medical Screening: Employees should be screened for history of certain medical conditions (listed below) which might place the employee at increased risk from n-propyl acetate exposure.
     - Chronic respiratory disease: In persons with impaired pulmonary function, especially those with obstructive airway diseases, the breathing of n-propyl acetate might cause exacerbation of symptoms due to its irritant properties.
     - Skin disease: n-Propyl acetate is a defatting agent and can cause dermatitis on prolonged exposure. Persons with pre-existing skin disorders may be more susceptible to the effects of this agent.
     - Kidney disease: Although n-propyl acetate is not known as a kidney toxin in humans, the importance of this organ in the elimination of toxic substances justifies special consideration in those with possible impairment of renal function.
     - Liver disease: Although n-propyl acetate is not known as a liver toxin in humans, the importance of this organ in the biotransformation and detoxification of foreign substances should be considered before exposing persons with impaired liver function.
  2. Periodic Medical Examination: Any employee developing the above-listed conditions should be referred for further medical examination.
- Summary of toxicology
  The toxicologic effects of n-propyl acetate are chiefly irritation of the conjunctiva and upper respiratory tract, followed by narcosis. Cats exposed to 5300 ppm for 6 hours daily showed eye irritation and salivation; at 24,500 ppm there was narcosis and death. No chronic systemic effects have been reported in humans.

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance with all requirements of OSHA regulations.

CHEMICAL AND PHYSICAL PROPERTIES

- Physical data
  1. Molecular weight: 102
  2. Boiling point (760 mm Hg): 101.6 C (215 F)
  3. Specific gravity (water = 1): 0.89
  4. Vapor density (air = 1 at boiling point of n-propyl acetate): 3.5
  5. Melting point: — 95 C (-140 F)
  6. Vapor pressure at 20 C (68 F): 25 mm Hg
  7. Solubility in water, g/100 g water at 20 C (68 F): 2
  8. Evaporation rate (butyl acetate = 1): 2.75

- Reactivity
  1. Conditions contributing to instability: Heat
  2. Incompatibilities: Contact with nitrates, strong oxidizers, strong alkalies, and strong acids may cause fires and explosions.
  3. Hazardous decomposition products: Toxic gases and vapors (such as carbon monoxide) may be released in a fire involving n-propyl acetate.
  4. Special precautions: n-Propyl acetate will dissolve many plastics and resins.

- Flammability
  1. Flash point: 14 C (58 F) (closed cup)
  2. Autoignition temperature: 450 C (842 F)
  3. Flammable limits in air, % by volume: Lower: 2; Upper: 8

- Extinguishing Agent: Dry chemical, carbon dioxide, alcohol foam

- Warning properties
  1. Odor Threshold: According to the Handbook of Organic Industrial Solvents, the odor of n-propyl acetate is detectable at the permissible exposure limit.
  2. Eye Irritation Level: The Handbook of Organic Industrial Solvents states that n-propyl acetate "causes irritation of mucous membranes at the threshold limit."
  3. Evaluation of Warning Properties: Through its odor and irritant effects, n-propyl acetate can be detected at the TLV. For the purposes of this guideline, therefore, it is treated as a material with good warning properties.

MONITORING AND MEASUREMENT PROCEDURES

- General
  Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee’s breathing zone (air that would most nearly represent that inhaled by the employee).

- Method
  Sampling and analyses may be performed by collection of n-propyl acetate vapors using an adsorption tube with subsequent desorption with carbon disulfide and gas chromatographic analysis. Also, detector tubes cert-ified by NIOSH under 42 CFR Part 84 or other direct-reading devices calibrated to measure n-propyl acetate may be used. An analytical method for n-propyl acetate is in the NIOSH Manual of Analytical Methods. 2nd Ed., Vol. 2, 1977, available from the Government Printing Office, Washington, D.C. 20402 (GPO No. 017-033-00260-6).

RESPIRATORS

- Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.

- In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

PERSONAL PROTECTIVE EQUIPMENT

- Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent repeated or prolonged skin contact with liquid n-propyl acetate.

- Clothing wet with liquid n-propyl acetate should be placed in closed containers for storage until it can be discarded or until provision is made for the removal of n-propyl acetate from the clothing. If the clothing is to be laundered or otherwise cleaned to remove the n-propyl acetate, the person performing the operation should be informed of n-propyl acetate’s hazardous properties.

- Any clothing which becomes wet with liquid n-propyl acetate should be removed immediately and not reworn until the n-propyl acetate is removed from the clothing.

- Employees should be provided with and required to use splash-proof safety goggles where liquid n-propyl acetate may contact the eyes.

SANITATION

- Skin that becomes wet with liquid n-propyl acetate should be promptly washed or showered with soap or
mild detergent and water to remove any n-propyl acetate.

COMMON OPERATIONS AND CONTROLS

The following list includes some common operations in which exposure to n-propyl acetate may occur and control methods which may be effective in each case:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use in spray, brush, or dip application of lacquers</td>
<td>Local exhaust ventilation; general dilution ventilation; personal protective equipment</td>
</tr>
<tr>
<td>Use during application of adhesives; manufacture of lacquers and adhesives</td>
<td>Local exhaust ventilation; general dilution ventilation</td>
</tr>
<tr>
<td>Use as a solvent for rubber; during application of solvent for plastics, nitrocellulose, and cellulose derivatives and resins; during brush or dip applications of lacquers; during preparation of flavoring agents and perfumes</td>
<td>General dilution ventilation</td>
</tr>
</tbody>
</table>

EMERGENCY FIRST AID PROCEDURES

In the event of an emergency, institute first aid procedures and send for first aid or medical assistance.

• Eye Exposure
  If n-propyl acetate gets into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. Get medical attention as soon as possible. Contact lenses should not be worn when working with this chemical.

• Skin Exposure
  If n-propyl acetate gets on the skin, promptly flush the contaminated skin with water. If n-propyl acetate soaks through the clothing, remove the clothing immediately and flush the skin with water. If there is skin irritation, get medical attention.

• Breathing
  If a person breathes in large amounts of n-propyl acetate, move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. Keep the affected person warm and at rest. Get medical attention as soon as possible.

• Swallowing
  When n-propyl acetate has been swallowed, get medical attention immediately. If medical attention is not immediately available, get the affected person to vomit by having him touch the back of the throat with his finger or by giving him large amounts (one pint or more) of warm salt water (two tablespoons of salt per pint of water). Do not make an unconscious person vomit.

• Rescue
  Move the affected person from the hazardous exposure. If the exposed person has been overcome, notify someone else and put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility’s emergency rescue procedures and know the locations of rescue equipment before the need arises.

SPILL, LEAK, AND DISPOSAL PROCEDURES

• Persons not wearing protective equipment and clothing should be restricted from areas of spills or leaks until cleanup has been completed.

• If n-propyl acetate is spilled or leaked, the following steps should be taken:
  1. Remove all ignition sources.
  2. Ventilate area of spill or leak.
  3. For small quantities, absorb on paper towels. Evaporate in a safe place (such as a fume hood). Allow sufficient time for evaporating vapors to completely clear the hood ductwork. Burn the paper in a suitable location away from combustible materials. Large quantities can be collected and atomized in a suitable combustion chamber. n-Propyl acetate should not be allowed to enter a confined space, such as a sewer, because of the possibility of an explosion.

• Waste disposal methods:
  n-Propyl acetate may be disposed of:
  1. By absorbing it in vermiculite, dry sand, earth or a similar material and disposing in a secured sanitary landfill.
  2. By atomizing in a suitable combustion chamber.
