Occupational Health Guideline for
Talc (Non-Asbestos Form)

INTRODUCTION
This guideline is intended as a source of information for
employees, employers, physicians, industrial hygienists,
and other occupational health professionals who may
have a need for such information. It does not attempt to
present all data; rather, it presents pertinent information
and data in summary form.

SUBSTANCE IDENTIFICATION
• Formula: No specific formula
• Synonyms: Hydrous magnesium silicate; steatite talc;
  non-fibrous talc; non-asbestiform talc
• Appearance and odor: Odorless solid.

PERMISSIBLE EXPOSURE LIMIT (PEL)
The current OSHA standard for talc is 20 million
particles of talc per cubic foot of air (mppcf) averaged
over an eight-hour work shift. The American Confer-
ce of Governmental Industrial Hygienists has issued a
Notice of Intended Changes of its recommended
Threshold Limit Value for talc (non-asbestos form)
from 20 mppcf to 15 mppcf or 2 mg/m³ respirable dust.
• Method
At the time of publication of this guideline, no measure-
ment method for talc had been published by NIOSH.

HEALTH HAZARD INFORMATION
• Routes of exposure
Talc can affect the body if it is inhaled or if it comes in
contact with the eyes.
• Effects of overexposure
Repeated inhalation of non-asbestos form of talc dust
might cause scarring of the lungs with shortness of
breath, chronic cough, and heart failure. The non-
asbestos form of talc may cause irritation of the eyes in
the same manner as nuisance dusts.
• Reporting signs and symptoms
A physician should be contacted if anyone develops any
signs or symptoms and suspects that they are caused by
exposure to talc.
• Recommended medical surveillance
The following medical procedures should be made
available to each employee who is exposed to talc at
potentially hazardous levels:
1. Initial Medical Examination:
   —A complete history and physical examination: The
   purpose is to detect pre-existing conditions that might
   place the exposed employee at increased risk, and to
   establish a baseline for future health monitoring. Exam-
   ination of the lungs and cardiovascular system should be
   stressed.
   —14" x 17" chest roentgenogram: The non-asbestos
   form of talc may have the potential to cause pulmonary
   fibrosis and cancer. Surveillance of the lungs is indicat-
   ed.
   —FVC and FEV (1 sec): Talc is reported to cause
decreased pulmonary function. Periodic surveillance is
   indicated.
2. Periodic Medical Examination: The aforementioned
   medical examinations should be repeated on an annual
   basis.
• Summary of toxicology
The non-asbestos form of talc, also termed nonfibrous,
has been reported to cause talcosis although this is
controversial. It has not been proven to cause the
effects produced by exposure to fibrous talc: fibrotic
pneumoconiosis and an increased incidence of cancer of
the lungs and pleura. In a study of 20 workers exposed
for 10 to 36 years to talc described as “pure,” at levels
ranging from 15 to 35 mppcf, no evidence of pneu-
moconiosis was found. In another study which compared
the pulmonary function of workers exposed to either
fibrous or nonfibrous talc, it was concluded that while
the fibrous form was the more pathogenic type, both
talcs produced pulmonary fibrosis; no data were pre-
sented to document the types of talc involved. An
epidemiologic study of 260 workers with 15 or more

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will
assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance
with all requirements of OSHA regulations.

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES
Public Health Service  Centers for Disease Control
National Institute for Occupational Safety and Health

U.S. DEPARTMENT OF LABOR
Occupational Safety and Health Administration

September 1978
years of exposure to commercial talc dust containing pure talc, plus tremolite, anthophyllite, carbonate dusts, and a small amount of free silica revealed a fourfold greater than expected proportional mortality from cancer of the lungs and pleura; in addition, a major cause of death was cor pulmonale, a result of the pneumoconiosis; the effects were likely due to the asbestos-form contaminants. The role of nonfibrous talc in these disease states could not be assessed.

CHEMICAL AND PHYSICAL PROPERTIES

- Physical data
  1. Molecular weight: 295
  2. Boiling point (760 mm Hg): Not applicable
  3. Specific gravity (water = 1): 2.5 — 2.8
  4. Vapor density (air = 1 at boiling point of talc): Not applicable
  5. Melting point: 900 — 1000 C (1652 — 1832 F) (loses water)
  6. Vapor pressure at 20 C (68 F): Essentially zero
  7. Solubility in water, g/100 g water at 20 C (68 F): Insoluble
  8. Evaporation rate (butyl acetate = 1): Not applicable
- Reactivity
  1. Conditions contributing to instability: None
  2. Incompatibilities: None
  3. Hazardous decomposition products: None
  4. Special precautions: None
- Flammability
  1. Not combustible
- Warning properties
  Talc is not reported to be a significant eye irritant.

MONITORING AND MEASUREMENT PROCEDURES

- General
  Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee's breathing zone (air that would most nearly represent that inhaled by the employee).
- Method
  Sampling and analyses may be performed by collection of talc in an impinger, followed by dust counting utilizing an optical microscope. A detailed analytical method for talc may be obtained from the National Technical Information Service, U.S. Department of Commerce, Springfield, Virginia 22161, under the title “NIOSH Analytical Methods for Set R” (order number PB 262 403).

RESPIRATORS

- Good industrial hygiene practices recommend that engineering controls be used to reduce environmental concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.
- In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

COMMON OPERATIONS AND CONTROLS

The following list includes some common operations in which exposure to talc may occur and control methods which may be effective in each case:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use in cosmetic industry as face powder, body or dusting powder, soap, and toilet preparations; in pharmaceutical industry in tablets, pills, salves, and lotions</td>
<td>General dilution ventilation; dust collecting system; wet grinding; personal protective equipment</td>
</tr>
<tr>
<td>Liberation during mining and processing by crushing, drying, milling, and upgrading by flotation</td>
<td>General dilution ventilation; dust collecting system; wet grinding; personal protective equipment</td>
</tr>
<tr>
<td>Use as a filter and selective absorbent in paper industry; use in ceramics industry in high quality electronic products as insulation; use as a selective absorbent in rubber and plastics reinforcing; use in cleaning up oil spills</td>
<td>General dilution ventilation; personal protective equipment</td>
</tr>
</tbody>
</table>

EMERGENCY FIRST AID PROCEDURES

In the event of an emergency, institute first aid proce-
dures and send for first aid or medical assistance.

- **Eye Exposure**
  If the non-asbestos form of talc gets into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. If irritation is present after washing, get medical attention.

**SPILL AND DISPOSAL PROCEDURES**

- Persons not wearing protective equipment and clothing should be restricted from areas of spills until cleanup has been completed.
- If talc is spilled, the following steps should be taken:
  1. Ventilate area of spill.
  2. Collect spilled material in the most convenient and safe manner for reclamation or for disposal in a secured sanitary landfill.
- Waste disposal method:
  Talc may be disposed of in a secured sanitary landfill.
