Occupational Health Guideline for TEPP

INTRODUCTION

This guideline is intended as a source of information for employees, employers, physicians, industrial hygienists, and other occupational health professionals who may have a need for such information. It does not attempt to present all data; rather, it presents pertinent information and data in summary form.

SUBSTANCE IDENTIFICATION

- **Formula:** $(C_4H_{10})_4P_2O_7$
- **Synonyms:** Tetraethyl pyrophosphate, commercial 40%; ethyl pyrophosphate; bladan; nifost; vaptone; tetron; killax; mortopal
- **Appearance and odor:** Colorless to amber liquid with a faint fruity odor.

PERMISSIBLE EXPOSURE LIMIT (PEL)

The current OSHA standard for TEPP is 0.05 milligram of TEPP per cubic meter of air (mg/m$^3$) averaged over an eight-hour work shift.

HEALTH HAZARD INFORMATION

- **Routes of exposure**
  TEPP can affect the body if it is inhaled or if it comes in contact with the eyes or skin, or if it is swallowed. It may enter the body through the skin.

- **Effects of overexposure**
  1. **Short-term Exposure:** After inhalation of TEPP, breathing and eye effects are the first to appear. These include tightness of the chest, wheezing, a bluish discoloration of the skin, small pupils, aching in and behind the eyes, blurring of vision, tearing, runny nose, headache, and watering of the mouth. After swallowing TEPP, loss of appetite, nausea, vomiting, abdominal cramps, and diarrhea may appear within 2 hours. After skin absorption, sweating and twitching in the area of absorption may occur usually within 15 minutes to 4 hours. With severe intoxication by all routes, in addition to the above symptoms, weakness, generalized twitching and paralysis may occur and breathing may stop. In addition, dizziness, confusion, staggering, slurred speech, generalized sweating, irregular or slow heartbeat, convulsions, and coma may occur.

  2. **Long-term Exposure:** Repeated exposure to TEPP may make a person more susceptible to the effects of this and related chemicals. Repeated exposure to concentrations which are too small to produce symptoms after a single exposure may result in the onset of symptoms.

  3. **Reporting Signs and Symptoms:** A physician should be contacted if anyone develops any signs or symptoms and suspects that they are caused by exposure to TEPP.

- **Recommended medical surveillance**
  The following medical procedures should be made available to each employee who is exposed to TEPP at potentially hazardous levels:

  1. **Initial Medical Examination:**
  - A complete history and physical examination: The purpose is to detect pre-existing conditions that might place the exposed employee at increased risk, and to establish a baseline for future health monitoring. Persons with a history of reduced pulmonary function, convulsive disorders, or recent exposure to anticholinesterase agents would be expected to be at increased risk from exposure. Examination of the respiratory system, nervous system, cardiovascular system, and attention to the cholinesterase levels in the blood should be stressed.

    - Cholinesterase determination: TEPP causes depressed levels of activity of cholinesterase in the serum and erythrocytes. The cholinesterase activity in the serum and erythrocytes should be determined by using medically acceptable biochemical tests prior to new period of exposure.

    2. **Periodic Medical Examination:** The aforementioned medical examinations should be repeated on an annual basis, with the exception of the cholinesterase determination which should be performed quarterly or at any

---

These recommendations reflect good industrial hygiene and medical surveillance practices and their implementation will assist in achieving an effective occupational health program. However, they may not be sufficient to achieve compliance with all requirements of OSHA regulations.

September 1978
time overexposure is suspected or signs or symptoms of toxicity occur.

- **Summary of toxicology**

TEPP (tetraethyl pyrophosphate) is an anticholinesterase agent; absorption may occur from inhalation of the mist, by skin absorption, or by ingestion of the liquid. Signs and symptoms of overexposure are caused by the inactivation of the enzyme cholinesterase, which results in the accumulation of acetylcholine at synapses in the nervous system, skeletal and smooth muscle, and secretory glands. The sequence of the development of systemic effects varies with the route of entry. The onset of signs and symptoms occurs promptly and almost always within 12 hours. After inhalation, respiratory and ocular effects are the first to appear, often within a few minutes after exposure. Respiratory effects include tightness in the chest and wheezing due to bronchoconstriction and excessive bronchial secretion; laryngeal spasms and excessive salivation may add to the respiratory distress; cyanosis may also occur. Ocular effects include miosis, acheing in and behind the eyes (attributed to ciliary spasm), blurring of distant vision, tearing, rhinorrhea, and frontal headache. After ingestion, gastrointestinal effects such as anorexia, nausea, vomiting, abdominal cramps, and diarrhea appear within 15 minutes to 2 hours. After skin absorption, localized sweating and muscular fasciculations in the immediate area occur usually within 15 minutes to 4 hours; skin absorption is somewhat greater at higher ambient temperatures, and is increased by the presence of dermatitis. With severe intoxication by all routes, an excess of acetylcholine at the neuromuscular junctions of skeletal muscle causes weakness aggravated by exertion, involuntary twitching, fasciculations, and eventually paralysis; the most serious consequence is paralysis of the respiratory muscles. Effects on the central nervous system include giddiness, confusion, ataxia, slurred speech, Cheyne-Stokes respiration, convulsions, coma, and loss of reflexes. The blood pressure may fall to low levels, and cardiac irregularities including complete heart block may occur; these effects may sometimes be reversed by establishing adequate pulmonary ventilation. Complete symptomatic recovery usually occurs within one week; increased susceptibility to the effects of anticholinesterase agents persists for one to several days after exposure. Daily exposure to concentrations which are insufficient to produce symptoms following a single exposure may result in the onset of symptoms. Continued daily exposure may be followed by increasingly severe effects. Mild intoxication was reported in 15 people exposed to a dust of 1% TEPP under unusual conditions of static air; the predominant symptom was shortness of breath which occurred after breathing the dust-laden air for 30 minutes; symptoms rapidly abated after exposure was terminated.

**CHEMICAL AND PHYSICAL PROPERTIES**

- **Physical data**
  1. Molecular weight: 290.2
  2. Boiling point (760 mm Hg): Decomposes
  3. Specific gravity (water = 1): 1.2
  4. Vapor density (air = 1 at boiling point of TEPP): Not applicable
  5. Melting point: Gradually sets to glass below 0 C (32 F)
  6. Vapor pressure at 140 C (284 F): 1 mm
  7. Solubility in water, g/100 g water at 20 C (68 F): Miscible in all proportions
  8. Evaporation rate (butyl acetate = 1): Not applicable
- **Reactivity**
  1. Conditions contributing to instability: Temperatures above 150 C (300 F) cause decomposition with formation of flammable ethylene gas.
  2. Incompatibilities: Contact with strong oxidizers may cause fires and explosions.
  3. Hazardous decomposition products: Toxic gases and vapors (such as phosphoric acid mist and carbon monoxide) may be released when TEPP decomposes.
  4. Special precautions: TEPP will attack some forms of plastics, rubber, and coatings.
- **Flammability**
  1. Not combustible
- **Warning properties**
  1. Odor Threshold: No quantitative information is available concerning the odor threshold of TEPP.
  2. Eye Irritation Level: TEPP is not known to produce a local, irritant effect upon the eye. According to Grant, however, when absorbed by the eye, TEPP can cause visual disturbances.
  3. Evaluation of Warning Properties: No quantitative information is available relating warning properties to air concentrations of TEPP. TEPP, therefore, is treated as a material with poor warning properties.

**MONITORING AND MEASUREMENT PROCEDURES**

- **General**

Measurements to determine employee exposure are best taken so that the average eight-hour exposure is based on a single eight-hour sample or on two four-hour samples. Several short-time interval samples (up to 30 minutes) may also be used to determine the average exposure level. Air samples should be taken in the employee’s breathing zone (air that would most nearly represent that inhaled by the employee).

- **Method**

**RESPIRATORS**

- Good industrial hygiene practices recommend that engineering controls be used to reduce environmental
concentrations to the permissible exposure level. However, there are some exceptions where respirators may be used to control exposure. Respirators may be used when engineering and work practice controls are not technically feasible, when such controls are in the process of being installed, or when they fail and need to be supplemented. Respirators may also be used for operations which require entry into tanks or closed vessels, and in emergency situations. If the use of respirators is necessary, the only respirators permitted are those that have been approved by the Mine Safety and Health Administration (formerly Mining Enforcement and Safety Administration) or by the National Institute for Occupational Safety and Health.

* In addition to respirator selection, a complete respiratory protection program should be instituted which includes regular training, maintenance, inspection, cleaning, and evaluation.

**PERSONAL PROTECTIVE EQUIPMENT**

* Employees should be provided with and required to use impervious clothing, gloves, face shields (eight-inch minimum), and other appropriate protective clothing necessary to prevent any possibility of skin contact with TEPP.
* Clothing contaminated with TEPP should be placed in closed containers for storage until it can be discarded or until provision is made for the removal of TEPP from the clothing. If the clothing is to be laundered or otherwise cleaned to remove the TEPP, the person performing the operation should be informed of TEPP’s hazardous properties.
* Where there is any possibility of exposure of an employee’s body to TEPP, facilities for quick drenching of the body should be provided within the immediate work area for emergency use.
* Non-impervious clothing which becomes contaminated with TEPP should be removed immediately and not reworn until the TEPP is removed from the clothing.
* Employees should be provided with and required to use splash-proof safety goggles where there is any possibility of TEPP contacting the eyes.
* Where there is any possibility that employees’ eyes may be exposed to TEPP, an eye-wash fountain should be provided within the immediate work area for emergency use.

**SANITATION**

* Skin that becomes contaminated with TEPP should be immediately washed or showered to remove any TEPP.
* Eating and smoking should not be permitted in areas where TEPP is handled, processed, or stored.
* Employees who handle TEPP should wash their hands thoroughly before eating, smoking, or using toilet facilities.

**COMMON OPERATIONS AND CONTROLS**

The following list includes some common operations in which exposure to TEPP may occur and control methods which may be effective in each case:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application as a contact insecticide on</td>
<td>Personal protective equipment</td>
</tr>
<tr>
<td>agricultural and ornamental crops, including</td>
<td></td>
</tr>
<tr>
<td>use in greenhouses</td>
<td></td>
</tr>
<tr>
<td>Formulation of insecticides</td>
<td>General dilution ventilation; personal</td>
</tr>
<tr>

**EMERGENCY FIRST AID PROCEDURES**

In the event of an emergency, institute first aid procedures and send for first aid or medical assistance.

* **Eye Exposure**
  If TEPP or formulations containing TEPP get into the eyes, wash eyes immediately with large amounts of water, lifting the lower and upper lids occasionally. Get medical attention immediately. Contact lenses should not be worn when working with this chemical.

* **Skin Exposure**
  If TEPP or formulations containing TEPP get on the skin, immediately wash the contaminated skin with water. If TEPP or formulations containing TEPP penetrate through the clothing, remove the clothing immediately and wash the skin with water. Get medical attention immediately.

* **Breathing**
  If a person breathes in large amounts of TEPP, move the exposed person to fresh air at once. If breathing has stopped, perform artificial respiration. Keep the affected person warm and at rest. Get medical attention as soon as possible.

* **Swallowing**
  When TEPP or formulations containing TEPP have been swallowed and the person is conscious, give the person large quantities of water immediately. After the water has been swallowed, try to get the person to vomit by having him touch the back of his throat with his finger. Do not make an unconscious person vomit. Get medical attention immediately.

* **Rescue**
  Move the affected person from the hazardous exposure. If the exposed person has been overcome, notify someone else and put into effect the established emergency rescue procedures. Do not become a casualty. Understand the facility’s emergency rescue procedures and
know the locations of rescue equipment before the need arises.

**SPILL, LEAK, AND DISPOSAL PROCEDURES**

- Persons not wearing protective equipment and clothing should be restricted from areas of spills or leaks until cleanup has been completed.
- If TEPP is spilled or leaked, the following steps should be taken:
  1. Ventilate area of spill or leak.
  2. Collect for reclamation or absorb in vermiculite, dry sand, earth, or a similar material.
- Waste disposal method:
  TEPP may be disposed of by absorbing in vermiculite, dry sand, earth, or a similar material and disposing in sealed containers in a secured sanitary landfill.

<tr>
<td></td>
<td>A combination respirator which includes a Type C supplied-air respirator with a full facepiece operated in pressure-demand or other positive pressure or continuous-flow mode and an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive pressure mode.</td>
</tr>
<tr>
<td>Fire Fighting</td>
<td>Self-contained breathing apparatus with a full facepiece operated in pressure-demand or other positive pressure mode.</td>
</tr>
<tr>
<td>Escape</td>
<td>Any gas mask providing protection against organic vapors and particulates, including pesticide respirators which meet the requirements of this class.</td>
</tr>
<tr>
<td></td>
<td>Any escape self-contained breathing apparatus.</td>
</tr>
</tbody>
</table>

*Only NIOSH-approved or MSHA-approved equipment should be used.

**Use of supplied-air suits may be necessary to prevent skin contact while providing respiratory protection from airborne concentrations of TEPP; however, this equipment should be selected, used, and maintained under the immediate supervision of trained personnel. Where supplied-air suits are used above a concentration of 10 mg/m³, an auxiliary self-contained breathing apparatus operated in positive pressure mode should also be worn.
