Standardized Variables for State Surveillance of Pesticide-Related Illness and Injury

This document contains a standardized set of variables for pesticide-related illness and injury. These standardized variables were developed through a collaboration that included experts from federal agencies (NIOSH, US EPA, NCEH), non-federal agencies (CSTE, AOEC) and state health departments or other state designees. The variables indicated as core variables for this condition are required from all NIOSH-funded surveillance programs. However, states are encouraged to provide data for all of the variables. The NIOSH core variable name is provided in bold, followed by the variable name in the SPIDER database system shown in parentheses. The data is best managed with a relational database structure. See the SPIDER Technical Manual for an example of database design.

The variable formats conform to CDC recommendations and to maintain consistency with available national data useful for rate calculation and comparisons (e.g., data collected by the Bureau of Labor Statistics, the National Center for Health Statistics, and the Bureau of the Census). Note that the recommended variable type (e.g. numeric, character) is included in this document.

Comments follow each variable, which explain the intended use of the variable. The comments also describe the discussion with state and federal agency partners during the development of the variables and coding schemes. Additional detail and clarification are available in the appendices that include a set of frequently asked questions (FAQ) document.

Some states choose not to collect information on cases associated with exposures to disinfectants. However, the variables are designed to allow this information to be captured, although these cases may not be routinely reported to the national surveillance system. To obtain more information, or the most current version of this document contact:

STANDARDIZED VARIABLES FOR STATE SURVEILLANCE OF 
PESTICIDE-RELATED ILLNESS AND INJURY

ADMINISTRATIVE AND DEMOGRAPHIC DATA .............................................................. 1

STATE (CEVENTSTATE).................................................................................................. 1
Definition: Unique identifier for reporting state/territory

COUNTY (CEVENTFIPS).............................................................................................. 1
Definition: Unique identifier for county where the exposure event occurred

STATERES (CEXPOSTATE).......................................................................................... 1
Definition: Unique identifier for the state/territory where the individual resided at the time of exposure

COUNTYRES (CEXPOFIPS)........................................................................................ 1
Definition: County where the individual resided at the time of exposure

COUNTER_ID (CEXPID).............................................................................................. 2
Definition: Identifier for the record in the state system that will be used in the aggregated dataset

EVENTID (CEVENTID)............................................................................................... 2
Definition: Unique identifier for reported exposure event/location

DATEEVENT (DEVENT)................................................................................................. 2
Definition: Date of event

DATEEXPO (TFIRSTEXP).......................................................................................... 2
Definition: Date of exposure, or when the injury occurred

DATONSET (TONSET)................................................................................................. 2
Definition: Date of symptom onset as documented in the medical record or by self-report.

DALENTAB (DTESTDATE)........................................................................................ 3
Definition: Date of laboratory analysis for laboratory based reports

DATEREPT (DREPORT)............................................................................................... 3
Definition: Date report received by state agency

DATEOTH (DOTHER)................................................................................................. 3
Definition: Other date that the state agency desires to track.

DATECOMM (DREPORT)............................................................................................ 3
Definition: Comments to clarify information provided in the six date fields above.

LATENCY (EXPNLATENCY)....................................................................................... 4
Definition: Calculated number of days between the date of pesticide exposure and the date of report.

REPSRCE1 (CSRC1)................................................................................................. 4
Definition: Ascertainment source for initial case report. (If multiple reports are received this variable should code the source of the first report received by the surveillance system.)

REPSRCE2 (CSRC2)................................................................................................. 5
Definition: Additional ascertainment source for case report. (If multiple reports are received this variable should code the source of the second report received by the surveillance system.)

REPSRCE3 (CSRC3)................................................................................................. 5
Definition: Additional ascertainment source for case report. (If multiple reports are received this variable should code the source of the third report received by the surveillance system.)

INTERVIEW (IW)...................................................................................................... 5
Definition: Indicates whether the affected individual or a third party was interviewed by surveillance staff.

MEDRECORDS (MEDRECS)...................................................................................... 5
Definition: Indicates whether medical records on the affected individual were received.

SEX (CCASESEX).................................................................................................... 5
Definition: Sex of disease or injury case

DOB (DCASEDOB)................................................................................................... 6
Definition: Year, month, day of birth.

AGE (CCASEAGE).................................................................................................. 6
Definition: Age in years

HISPANIC (CCASEHISP)....................................................................................... 6
Exposure Descriptions

Definition: Indicator for self-identified Hispanic ethnicity

RACE (CCASERACE) ................................................................................................................................. 7
Definition: Self-described race of reported individual

industry/Occupation Data.............................................................................................................................. 7

WORKREL (CWORKREL) ........................................................................................................................ 7
Definition: Indicates causal relationship between illness/injury and case’s work

OCCUP (COCCUP) ................................................................................................................................. 7
Definition: Occupation/job title at time of injury or exposure. This is only reported for individuals with work-related exposures.

OCCCODE (COCC) ......................................................................................................................................... 8
Definition: Numeric 1990 US Census code for occupation described in OCCNAR

OCCCODE2002 (CCOC2002) ....................................................................................................................... 8
Definition: Numeric 2002 US Census code for occupation described in OCCNAR

OCCNAR (COCCNAR) ............................................................................................................................... 8
Definition: Describes additional information about the occupation, industry or work-relatedness of the exposure not covered in variables in this section.

IND (CINDNARR) ........................................................................................................................................ 8
Definition: Industry at time of injury or exposure

INDSIC (CSIC) ............................................................................................................................................... 9
Definition: SIC Code for industry described in IND

INDCIC (CCIC) ........................................................................................................................................... 9
Definition: 1990 Census Industry Classification System industry code

NAICS (CNAICS) ......................................................................................................................................... 9
Definition: North American Industry Classification System industry code

INDCIC2002 (CCIC2002) .............................................................................................................................. 9
Definition: 2002 Census Industry Classification System industry code

Exposure Descriptions................................................................................................................................. 10

Type of Exposure........................................................................................................................................ 10

DRIFT (LDRIFT) ......................................................................................................................................... 10
Definition: Indicates whether the individual was exposed via the movement of pesticides away from the treatment site. The pesticide spray, mist, fumes, or odor are carried from the target site by air.

TARGETED (LTARGETED) .......................................................................................................................... 11
Definition: The individual was exposed to an application of a pesticide material released at the target site, and not carried from the target site by air. The pesticide may be any formulation type (granular dust, aerosol, liquid, etc.). Hand application by any method is included as well as the use of all forms of application equipment. Exposure to the material can be by direct projection, ricochet, blow back by wind onto the applicator during the application process, or airborne exposure to anyone moving through an area being actively treated.

SPRAY (LSPRAY)...................................................................................................................................... 11
Definition: Individual exposed to pesticide material propelled by the application or mixing/loading equipment. The pesticide may be any formulation type (granular dust, aerosol, liquid, etc.). Exposure to the material can be by direct projection or by ricochet. Note that pesticide material blown back onto the applicator during the application process or exposure to the applicator while moving through the treated area is coded as SPRAY.

INDOORAIR (LINDOORAIR) .................................................................................................................... 11
Definition: The individual was exposed via indoor air contamination (this includes residential, commercial and greenhouse indoor air).

SURFACE (LSURFACE) ............................................................................................................................ 12
Definition: The individual was exposed via contact with pesticide residues on treated surface (plant material, carpets, treated animal) or entry into an outdoor treated area. Any contact or secondary contact with residues is coded as SURFACE. (An example of secondary contact is person touches treated plant, and then touches self.) The treated surface may include contact with the individual’s own clothing or body part...
that was treated (e.g. applied pesticide spray to back of forearms and hands, and then rubbed eyes with back of hand.)

**LEAKSPILL (LEAKSPILL)**
Definition: The individual was exposed to a leak or spill of pesticide material from any cause. The leak or spill could have occurred at the time of exposure (e.g., an applicator exposed to pesticides from a leaking backpack sprayer) or prior to the exposure (e.g., emergency workers exposed to a pesticide spilled during a truck accident; the accident occurred hours before the exposure).

**CONTACT (LCONTACT)**
Definition: The individual was exposed via other direct contact not included in SPRAY or SURFACE. This includes: 1) Contact made during an application or mixing/loading operation where the material is not propelled by the equipment; 2) Expected direct contact during use (e.g. washing dishes in a disinfectant solution); 3) Leaks, spills, etc. not related to an application, including during emergency response; 4) handling a pesticide delivery device (e.g., dispenser, trap, pheromone strip).

**TYPEUNK (LTYPEUNK)**
Definition: Indicates if the type of exposure does not fit into any of the categories of exposure described in the previous five variables.

**ROUTE OF EXPOSURE**

<table>
<thead>
<tr>
<th>Definition</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indicates whether the individual was exposed to the pesticide by the dermal route of exposure.</td>
<td>DERMAL (LDERMAL)</td>
</tr>
<tr>
<td>Indicates whether the individual was exposed to the pesticide by inhalation.</td>
<td>INHALE (LINHALE)</td>
</tr>
<tr>
<td>Indicates whether the individual ingested pesticide.</td>
<td>INGESTION (LINGESTION)</td>
</tr>
<tr>
<td>Indicates whether the individual was exposed to the pesticide by injection.</td>
<td>INJECTION (LINJECTION)</td>
</tr>
<tr>
<td>Indicates whether the individual was exposed to the pesticide by the splash, spill or spray to the eye.</td>
<td>OCULAR (LOCCULAR)</td>
</tr>
<tr>
<td>Indicates if the type of exposure is unknown.</td>
<td>ROUTEUNK (LROUTEUNK)</td>

</tbody>
</table>

**EQUIPMENT (CEQUIPMENT)**

Definition: Describes the type of equipment or application method used for the application. This should be coded regardless of whether it was used by the exposed individual or another individual who performed the pesticide application.

**APPLICCTR (CAPPSUP)**

Definition: Indicates the licensing and supervision of the individual who performed the application.

**APPTARGT (CTARGET)**

Definition: This variable describes the target surface for the pesticide application.

**APPSITE (CEVENTSITE)**

Definition: Location where the application or event (e.g., spill, transport accident, fire) associated with the exposure took place.

**CASESITE (CSITE)**

Definition: Description of the type of location where the exposed individual was when they were exposed.

**PURPOSE (CPURPOSE)**

Definition: The purpose for community-wide target applications.

**SPECPEST (CSPECPEST)**

Definition: Specific pest target for community-wide target applications (code 801 under APPTARGT).

**CROP (CCROP)**

Definition: This variable describes the crop or commodity involved when the crop is not the application target (see comments for clarification).

**EXPOCOMM (CEXPCOMM)**

Definition: Describes additional important aspects of exposure not covered in variables in this section.

**AGENT INFORMATION**

**REG_NR (REG_NR)**

Definition: The EPA Registration Number for the product composed of the 11-digit product registration number (1-6 digit manufacturer and 1-5 digit product identification numbers) and the 6-digit distributor number.

**EPAREG_NR (EPAREG_NR)**

Definition: The EPA Registration Number for the product composed of the 11-digit product registration number (1-6 digit manufacturer and 1-5 digit product identification numbers) only.

**DIST_NR (DIST_NR)**

Definition: The 6-digit distributor number assigned by the EPA.

**PRODUCT (CPRODNAME)**

Definition: Manufacturer's designated name for the product.

**ACTIVING (PC_CODE, EPA CODE, Chemical ID)**

Definition: EPA designated code for the active ingredient.
**PREFNAME (CPREFNAME)**
Definition: The flag to designate the NIOSH-SENSOR-Pesticides preferred chemical name associated with a particular EPA designated PC Code.

**ACTINGP (NPESTPCNT)**
Definition: The percentage by weight of the active ingredient(s) contained in the pesticide product.

**CHEMCLAS (CCCLASS)**
Definition: Chemical classification of active ingredient

**PRODCLAS (CPRDCLASS)**
Definition: Chemical classification of the product

**FUNCLAS (CPRODTYPE)**
Definition: Functional classification of pesticide product.

**FORM (CPRODFORM2)**
Definition: Indicates the physical formulation of the product.

**TOXCODE (CTOXCODE)**
Definition: EPA Signal word.

**ATTRIBUT (CATTRIBAI)**
Definition: EPA designated code for the attributed active ingredient.

**AGCOM (CAGENT)**
Definition: Describes additional important information about the pesticides involved in the exposure that is not captured by the variables in this section.

**EVENTNARR (MEVENT)**
Definition: Describes additional important aspects of exposure not covered in other variables.

**HEALTH EFFECT DESCRIPTORS**

**BIOLOGIC MONITORING**

**CHLNTEST (CTESTTYPE)**
Definition: Indicates which cholinesterase test(s) if any, were performed.

**CHLNRESL (CRESULT)**
Definition: Indicates the results of cholinesterase testing, and what standard was used for the "normal" comparison.

**OTHRBIO (COTHERTEST)**
Definition: Describes whether other biologic monitoring for pesticides and metabolites was performed that is not captured in previous variables.

**MEDICAL DIAGNOSIS**

**MEDDIAG (CDIAGNOSIS)**
Definition: Provides a description of the medical diagnosis by the attending health care provider.

**PREEXCON (No Equivalent SPIDER Variable)**
Definition: Indicates whether the exposed individual had any pre-existing conditions that could impact on their response to exposure.

**COND1 (CPREGNANT)** Pregnant

**COND2 (CASTHMA)** Asthma

**COND3 (CALLERGIES)** Allergies (Note the specific allergy under COND5 (Other) if coded as "1", "2" or "3" and the coder is unsure if the allergy would impact the individual's susceptibility to exposure.)

**COND4 (CMCS)** Multiple chemical sensitivities (acquired chemical intolerance)

**COND5 (COTHERPRE)**
Definition: Other. Describes other condition that could impact on the individual susceptibility to exposure that is not described in existing codes; or provides an explanation of coding for COND3 Allergies.

**FATAL (COUTCOME)**
Definition: Describes whether the exposed individual died, and if so whether the death was suspected to be related to pesticide exposure.

**SIGNS AND SYMPTOMS**

**DERMATOL (LDERMSYMP)**
Definition: Indicates whether health effect involved irritation or sensitization of skin.

**DERMI (BULLAE)**
Definition: Bullae

**DERM2 (CSKINBURN).** ................................................................................................................................. 38
Definition: Burns (second and third degree) This should include burns from chemical exposure only.

**DERM3 (CSKINEDEMA).** ............................................................................................................................. 38
Definition: Edema (Edema/Swelling) Edema may be associated with allergic responses, angioedema, hives, etc. Include edema of extremities and joints. Include periocular edema or swollen eyes.

**DERM4 (CREDNNESS).** ............................................................................................................................... 38
Definition: Erythema Redness of the skin. Include first degree burns (added in 2011), facial flushing, or hot sensation of the skin (not a burning sensation which is coded under DERM6).

**DERM5 (CRASH).** ........................................................................................................................................ 38
Definition: Rash/Irritation. Include: contact dermatitis, irritant dermatitis, rash, open skin sores, blepharitis, eczema.

**DERM6 (CSKINPAIN).** ................................................................................................................................. 38
Definition: Pain. Include: pain, sensation of burning skin not associated with a thermal burn.

**DERM7 (CPRURITIS).** .................................................................................................................................... 39
Definition: Pruritis. Itchy skin.

**DERM8 (PATTERN).** ...................................................................................................................................... 39
Definition: Describes the pattern of distribution for lesions described in the other DERM variables.

**DERM9 (CHIVES).** ....................................................................................................................................... 39
Definition: Hives

**DERM99 (COTHERDER).** ............................................................................................................................. 39
Definition: Describes other dermatologic signs or symptoms not described in existing codes.

**EYE (LOCCSYMP).** ........................................................................................................................................ 39
Definition: Indicates whether health effect involved direct contact with and injury to eye

**EYE1 (MIOSIS).** ............................................................................................................................................ 39
Definition: Miosis (Contraction of the pupil (pinpoint pupils)).

**EYE2 (CEYEBURN).** ...................................................................................................................................... 40
Definition: Burns (Any reaction described as a chemical burn to the eye.)

**EYE3 (CABRASION).** ..................................................................................................................................... 40
Definition: Corneal abrasion

**EYE4 (CTEARS).** ........................................................................................................................................... 40
Definition: Lacrimation (tearing of the eyes)

**EYE5 (CEYEPAINE).** ...................................................................................................................................... 40
Definition: Pain/irritation/inflammation (include the sensation of burning eyes or itching eyes, injection, irritation, red eyes)

**EYE6 (CMYDRIASIS).** ...................................................................................................................................... 40
Definition: Mydriasis (Extreme dilation of the pupil)

**EYE7 (CCONJDX).** ........................................................................................................................................ 40
Definition: Diagnosis of conjunctivitis. This variable should only be used for a diagnosis of conjunctivitis, when no specific information on signs and symptoms are provided.

**EYE8 (COTHEROCC).** .................................................................................................................................... 40
Definition: Describes other ocular symptoms not described in existing codes

**RESPIRAT (LRESP).** ....................................................................................................................................... 41
Definition: Indicates whether health effect involved upper or lower respiratory symptoms

**RESP1 (CCOUGH).** .......................................................................................................................................... 41
Definition: Cough

**RESP2 (CCYANOSIS).** ..................................................................................................................................... 41
Definition: Cyanosis (Bluish discoloration of the skin and mucous membranes associated with concentration of reduced hemoglobin in the blood.)

**RESP3 (CRESPPAIN).** .................................................................................................................................... 41
Definition: Upper respiratory pain/irritation Include: congestion, sinus pain, sore throat, runny nose, oral or nasal rash or blistering, persistent sneezing, burning tongue, laryngitis, post nasal drip, clogged ears, chest heaviness.

**RESP4 (CDYSPNEA).** ....................................................................................................................................... 41
<table>

NS2 (CRESTLESS) .............................................................................................................................................. 45
  Definition: Hyperactivity/anxiety/irritability (Include nervousness, anxious affect)
NS3 (COMA) .................................................................................................................................................. 45
  Definition: Coma
NS4 (CONFUSED) ........................................................................................................................................ 45
  Definition: Confusion (Include problems with thinking other than memory loss.)
NS5 (SEIZURE) .......................................................................................................................................... 45
  Definition: Seizure(s)
NS6 (CFASIC) ................................................................................................................................…………... 45
  Definition: Fasciculations (Localized contraction of muscles resulting from the discharge of fibers that
  are innervated by a single nerve filament. These contractions can be seen under the skin.)
NS7 (HEADACHE) ...................................................................................................................................... 45
  Definition: Headache
NS8 (CWEAKNESS) .................................................................................................................................. 45
  Definition: Muscle weakness
NS9 (CRIGIDITY) ........................................................................................................................................ 45
  Definition: Muscle rigidity
NS10 (CPARALYSIS) .................................................................................................................................. 45
  Definition: Paralysis
NS11 (CPEXOSTERNAL) ............................................................................................................................ 45
  Definition: Peripher neuropathy
NS12 (CSEIZURE) ...................................................................................................................................... 45
  Definition: Seizure(s)
NS13 (CSW) .................................................................................................................................................. 45
  Definition: Diaphoresis/Profuse sweating (diaphoresis, heavy sweating, cold sweat)
NS14 (CBLURRED) .................................................................................................................................. 45
  Definition: Blurred vision
NS15 (CDIZZY) ............................................................................................................................................ 46
  Definition: Dizziness
NS16 (CMUSCLE) ...................................................................................................................................... 46
  Definition: Muscle pain (muscle aches, neck pain, back pain)
NS17 (CPARESTHESIAS) ........................................................................................................................... 46
  Definition: Fainting
NS18 (CPYALTISM) .................................................................................................................................. 46
  Definition: Salivation (Include drooling and increased salivation)
NS19 (CPARESTHESIAS) .......................................................................................................................... 46
  Definition: Paresthesias (Sensation of burning or prickling of skin/tingling/numbness apart from a
  specific injury or rash)
NS20 (CALTEDTASTE) .............................................................................................................................. 46
  Definition: Altered taste (Include metallic taste or chemical taste.)
NS21 (CMEMORY) ................................................................................................................................... 46
  Definition: Memory loss
NS99 (COTHERNEU) ................................................................................................................................ 46
  Definition: Describes other nervous/sensory symptoms not described in existing codes
CARDVASC (LCARDIO) .......................................................................................................................... 46
  Definition: Indicates whether health effect includes cardiovascular symptoms
CV1 (CBRADY) .......................................................................................................................................... 46
  Definition: Bradycardia (fewer than 60 beats per minute for adults)
CV2 (CARREST) ......................................................................................................................................... 47
  Definition: Cardiac arrest (Include myocardial infarction.)
CV3 (CCONDUCT) .................................................................................................................................... 47
  Definition: Conduction disturbance (Include atrial arrhythmia, atrial fibrillation, sinus arrhythmia, or
  ventricular arrhythmia.)
CV4 (CFAINT) .......................................................................................................................................... 47
  Definition: Fainting

Peripheral neuropathy
Paralysis
Muscle rigidity
Muscle weakness
Headache
Fasciculations (Localized contraction of muscles resulting from the discharge of fibers that
are innervated by a single nerve filament. These contractions can be seen under the skin.)
Confusion (Include problems with thinking other than memory loss.)
Seizure(s)
Hyperactivity/anxiety/irritability (Include nervousness, anxious affect)

Standardized Variables for State Surveillance of Pesticide-Related Illness And Injury  Rev October 2015
### INVESTIGATION FINDINGS

**ENFORCEMENT AGENCY FINDINGS**

- **VIOLFIFRA (CVIOFI)FRA**
  - **Definition:** Indicates whether a violation of FIFRA or state pesticide regulations (including the Worker Protection Standard) was found by the regulatory agency responsible for enforcement of FIFRA and/or state pesticide regulations.

- **VOSHA (COSHA)**
  - **Definition:** Indicates whether a violation of occupational health or safety standards was cited by the regulatory agency responsible for enforcement of OSHA regulations.

- **VOTHER (CVIOL)**
  - **Definition:** Indicates whether other violations associated with pesticide use, storage, or transport were found by a regulatory agency.

- **VIOLCOM (CVIOLNAR)**
  - **Definition:** Describes additional important aspects of regulatory violations found not captured with variables in this section.

- **VIOLATION (CFIFRA)**
  - **Definition:** Indicates whether a violation of FIFRA (other than the Worker Protection Standard) was found by the regulatory agency responsible for enforcement of FIFRA.

- **VFIFRAWP (CEPA)**
  - **Definition:** Indicates whether a violation was found by the regulatory agency responsible for enforcement of FIFRA Worker Protection Standard.

**STATE SURVEILLANCE SYSTEM INVESTIGATION FINDINGS**

- **LABEL (CLABELUSE)**
  - **Definition:** Indicates whether there is evidence indicating that the product label was not followed.

- **CONTRIBUTING FACTOR NARRATIVE (PNARR)**
  - **Definition:** This variable should be used to provide details of the contributing factors.

- **CONTRIBUTING FACTORS (PCODE)**
  - **Definition:** Describes factors contributing to the exposure.

**WPS1A (CWPS1A)** [Question: Did this incident involve entering a treated field, area or greenhouse?] ....... 56
  - **Definition:** Indicates whether the exposure incident being investigated involved entry into an area, field, or greenhouse that had been treated with pesticides.

**WPS1B (CWPS1B)** [Question: Did the employer or the crew leaders tell you about how soon you could go into the area (field or greenhouse) after it was treated with pesticides?] .................................................. 56
  - **Definition:** Indicates whether the current employer or crew leaders had told the individual about how soon they could go into the area after it was treated with pesticides.

**WPS2 (CWPS2)** [Question: This season with your current employer, has your employer/crew leader(s) told you about illnesses or injuries that could be due to pesticides?] .................................................. 56
  - **Definition:** Indicates whether the current employer or crew leaders had told the individual during this season about illnesses or injuries that could be due to pesticides.

**TnxUNK (LTxUNK)**
  - **Definition:** Indicates that the type of medical care received by the individual is unknown.

**HOSPSTAY (NHOSPSTAY)**
  - **Definition:** Length of hospital stay, in days.

**LOSTTIME (CLOSTTIME)**
  - **Definition:** Indicates whether the individual lost one or more days from regular activities.

**LOSTWORK (NDLOSTW)**
  - **Definition:** Indicates the number of days the individual lost from work.

**LOSTACT (NDLOSTA)**
  - **Definition:** Indicates the number of days the individual lost from regular activities.

**HEALTHCOM (CHEALTHNAR)**
  - **Definition:** Describes additional important aspects of illness, medical history, severity captured with variables in this section.
WPS3 (CWPS3) [Question: This season with your current employer, has your employer/crew leader(s) ever told you about where to go or who to contact for emergency medical care for an illness or injury that happens at work?]
Definition: Indicates whether the current employer or crew leaders had told the individual this season about where to go or who to contact for emergency medical care for an illness or injury at work.

WPS4 (CWPS4) [Question: In the past 12 months has someone taught you about the safe use of pesticides and the use of personal protective equipment?]
Definition: Indicates whether the individual indicated that they had been taught about the safe use of pesticides and the use of PPE in the last 12 months.

CASE CLASSIFICATION
C_EXPOSE (CDOCEXP)
Definition: Describes the level of how laboratory, clinical or environmental evidence that corroborates exposure

C_EFFECT (CDOCHEALTH)
Definition: Level of documentation of post-exposure health effect

C_CAUSAL (CDOCCAUSE)
Definition: Level of evidence indicating a causal relationship between exposure and illness.

STATUS (CSTATUS)
Definition: Final case classification, using NIOSH classification matrix.

USERSTAT (CUSERSTATUS)
Definition: Final case classification, using state classification matrix, or overriding the NIOSH classification matrix with a written explanation.

USERREAS (CUSERREASO)
Definition: Explanation of why the final case classification indicated by STATUS and USERSTAT are different.

SEVERITY (CSEVERITY)
Definition: Final coding of the severity of the case using the standardized criteria of the severity index which can be found at http://www.cdc.gov/niosh/topics/pesticides/. A brief description of each of the six severity categories follows.

APPENDICES

APPENDIX A: OPERATIONAL GUIDELINES FOR DETERMINATION OF INJURY AT WORK

APPENDIX B: TABLE OF SOLVENTS AND SYNERGISTS EXCLUDED WHEN DETERMINING PRODUCT CHEMICAL CLASS OF INSECTICIDES (PRODCLAS)

APPENDIX C: FREQUENTLY ASKED QUESTIONS (FAQS) - CASE DEFINITION AND STANDARD VARIABLES FOR SURVEILLANCE OF PESTICIDE-RELATED ILLNESS AND INJURY
A. Case Definition
B. Standard Variables

APPENDIX D: CONTRIBUTING FACTORS CODING INSTRUCTIONS

APPENDIX E: VARIABLES FOUND IN THE NIOSH MULTI-STATE DATABASE BUT NOT PRESENT IN THE STANDARDIZED VARIABLE DOCUMENT

APPENDIX F: FORMULATION CODING CROSSWALK
ADMINISTRATIVE AND DEMOGRAPHIC DATA

STATE (CEVENTSTATE)
Definition: Unique identifier for reporting state/territory
Width: 2
Type: Character
Core: Yes
FAQ: B.1. (See Appendix C)
Coding: 2-letter postal code for the state or territory
Comment: Postal coding is used for ease of the reporting states.

COUNTY (CEVENTFIPS)
Definition: Unique identifier for county where the exposure event occurred
Width: 3
Type: Character
Core: Yes
FAQ: Coding: FIPS or other state designated coding system
Comment: This variable provides information on where events are occurring, and permits identification of clusters along state border areas. The FIPS (Federal information Process Standards codes issued by the National Bureau of Standards) is recommended since it conforms to CDC recommendations and enables comparison with census data. If states are currently using other systems, it is suggested that they provide the coding schemes to CDC to allow examination of the geographic distribution of cases. States are strongly encouraged to use FIPS coding. Some states do not collect the zip code for the event location so the county was determined to be the best variable to use. There are confidentiality concerns with this variable when there are few pesticide poisonings in a sparsely populated county. It might be possible for specific individuals to be identified in those instances. This problem can be resolved if information is only sent to NIOSH on an annual basis, and states have the option to send data for this variable only if the cell size is >3.

STATERES (CEXPOSTATE)
Definition: Unique identifier for the state/territory where the individual resided at the time of exposure
Width: 2
Type: Character
Core: Yes
FAQ: Coding: 2-letter postal code for the state or territory. If this is unknown code as "XX".
Comment: Postal coding is used for ease of the reporting states. This variable was accepted without discussion.

COUNTRYS (CEXPOFIPS)
Definition: County where the individual resided at the time of exposure
Width: 3
Type: Character
Core: Yes
FAQ: Coding: FIPS or other state designated coding system
Comment: Code the current county of residence at the time of exposure. For migrant or seasonal workers code the county where they are living at the time of exposure, not a permanent residence. This variable will help provide information on any clustering of exposed population on the basis of residence. The FIPS (Federal information Process Standards codes issued by the National Bureau of Standards) is recommended since it conforms to CDC recommendations and enables comparison with census data. If states are currently using other systems than it is suggested that they provide the coding schemes to CDC. This will allow states and others to examine geographic distribution of cases. States are strongly
encouraged to use FIPS coding. The greatest concern with this variable related to issues of confidentiality when there are few pesticide poisonings in a county with few residents. It might be possible for specific individuals to be identified in those instances. The concern is that if states report information to NIOSH even if they only report cells with greater than three cases, NIOSH may be required to release more specific information if it is requested. This problem can be resolved if information is only sent to NIOSH on an annual basis. States may then choose to send data for this variable if cell size is >3.

**COUNTER_ID (CEXPID)**

Definition: Identifier for the record in the state system that will be used in the aggregated dataset

Width: 8

Type: Numeric

Core: Yes

FAQ: Coding: This number should be right aligned and automatically assigned through form numbering or the counter in the state database system.

Comment: Each poisoned individual in a given exposure event should be assigned a unique identification number that is automatically assigned by the data system. The same individual could have several unique COUNTER_IDs if the individual was poisoned in several different exposure events (tracked by EVENT). The data system can also contain an identifier that tracks unique individuals although this is not required within the standard variable format. The issue of how to assign COUNTER_ID when an individual has multiple abnormal cholinesterase test results from multiple days remains to be determined.

**EVENTID (CEVENTID)**

Definition: Unique identifier for reported exposure event/location

Width: 8

Type: Character

Core: Yes

FAQ: Coding: As specified by surveillance system

Comment: Needed to identify multiple cases associated with a single exposure event/location.

**DATEEVENT (DEVENT)**

Definition: Date of event

Width: 8

Type: Date

Core: Yes

FAQ: Coding: YYYYMMDD format

Comment:

**DATEEXPO (TFIRSTEXP)**

Definition: Date of exposure, or when the injury occurred

Width: 8

Type: Date

Core: Yes (see comment)

FAQ: Coding: YYYYMMDD format

Comment: Enter level of information available, leaving missing information blank. Date will be truncated at earliest missing numeral. At least one of the variables DATEEXPO, DATONSET, or DATELAB must be completed with a valid date for inclusion in the national aggregated data.

**DATONSET (TONSET)**

Definition: Date of symptom onset as documented in the medical record or by self-report.
Width: 8
Type: Date
Core: Yes (see comment)
FAQ:
Coding: YYYYMMDD format
Comment: Enter level of information available, leaving missing information blank. Date will be truncated at earliest missing numeral. If system does not allow incomplete dates, then leave blank. At least one of the variables DATEEXPO, DATONSET or DATELAB must be completed with a valid date for inclusion in the national aggregated data.

DATELAB (DTESTDATE)
Definition: Date of laboratory analysis for laboratory based reports
Width: 8
Type: Date
Core: Yes (see comment)
FAQ:
Coding: YYYYMMDD format
Comment: Enter level of information available, leaving missing information blank. Date will be truncated at earliest missing numeral. If system does not allow incomplete dates, then leave blank. This variable should describe the date of analysis, which triggered report (e.g. cholinesterase, alkyl phosphate or other analysis). At least one of the variables DATEEXPO, DATONSET, or DATELAB must be completed with a valid date for inclusion in the national aggregated data.

DATEREPT (DREPORT)
Definition: Date report received by state agency
Width: 8
Type: Date
Core: Yes (see comment)
FAQ:
Coding: YYYYMMDD format
Comment: If multiple reports are received for a given individual and event, record the date of the first report to the surveillance system. Enter level of information available, leaving missing information blank. Date will be truncated at earliest missing numeral. If system does not allow incomplete dates, then leave blank.

DATEOTH (DOTHER)
Definition: Other date that the state agency desires to track.
Width: 8
Type: Date
Core: No
FAQ:
Coding: YYYYMMDD format
Comment: This allows tracking of other dates pertinent to the case that are not as commonly recorded but if available provide important information related to the case. Describe what the data in this field represents in the DATECOMM narrative.

DATECOMM (DATENARR)
Definition: Comments to clarify information provided in the six date fields above.
Width: 125
Type: Character
Core: Yes (see comment)
FAQ:
Coding: Literal narrative that describes the chronology of events or notes any clarification of data entered in the various date fields.
Comment: This field will be used to interpret information related to the date of report, exposure, onset, laboratory analysis and other date information provided. If the variable DATEOTH is use than an explanation of the type of date must be provided here.

**LATENCY (EXPNLATENCY)**

**Definition:** Calculated number of days between the date of pesticide exposure and the date of report.

**Width:** 3

**Type:** Numeric

**Core:** No

**FAQ:**

**Coding:**

Comment: SPIDER will calculate this value automatically. The preferred reference dates will be the date of report (DREPORT) and date of exposure (TFIRSTEXP). If latency cannot be calculated due to missing information, the following rules will be applied:

- Missing DREPORT Latency will be calculated as -1
- Missing TFIRSTEXP Use date of symptom onset (TONSET)
- Missing TONSET and TFIRSTEXP Use date of event (DEVENT)
- If TFIRSTEXP and TONSET and DEVENT are empty, latency coded as -2

**REPSRCE1 (CSRC1)**

**Definition:** Ascertainment source for initial case report. (If multiple reports are received this variable should code the source of the first report received by the surveillance system.)

**Width:** 2

**Type:** Character

**Core:** Yes

**FAQ:**

**Coding:**

- 01 = Physician report
- 02 = Poison control center
- 03 = Other health care provider report (including emergency room or hospital report)
- 04 = Laboratory report
- 05 = Death certificate or medical examiner's report
- 06 = Report or referral from governmental agency
- 07 = Obituary/news report
- 08 = Ascertainment through Workers' Compensation
- 09 = Self-report
- 10 = Co-worker report
- 11 = Friend or relative report
- 12 = Identified during site visit
- 13 = Worker representative (e.g., union, lawyer / legal services/other advocate)
- 14 = Medical record review (clinic or hospital record review performed by surveillance staff)
- 15 = Employer
- 21 = Agricultural nurse (refers specifically to nurses participating in a NIOSH funded Occupational Nurse in Agriculture project.)
- 97 = State health department
- 98 = Other (not captured in any code category listed)
- 99 = Unknown

Comment: The use of this variable will aid in evaluation of the surveillance systems. The coding for this variable has been condensed from earlier versions. States may choose to collect more detailed information for this variable by adding an additional column on the right. This third column should be used to code subcategories of the main category coded in the first two columns. (E.g. If there are 3 poison centers in a state the codes "021", "022" and "023" may be used to code for the specific poison centers allowing the state surveillance program to track reporting from each center; similarly a state might code ER reports as "031", nurse practitioners as "032", etc.). This variable will be truncated at two columns when data is aggregated. When an event includes multiple cases, code the report source for the specific case (e.g. for an event involving 5 cases, three of which were reported by the poison control center.
(PCC), and two more were referred by a co-worker captured by the PCC, the three original cases should be coded “02=PCC”, and cases four and five should be coded “10=co-worker report”).

**REPSRCE2 (CSRC2)**
Definition: Additional ascertainment source for case report. (If multiple reports are received this variable should code the source of the second report received by the surveillance system.)
Width: 2
Core: No
FAQ: Character
Coding: Same as REPSRCE1
Comment:

**REPSRCE3 (CSRC3)**
Definition: Additional ascertainment source for case report. (If multiple reports are received this variable should code the source of the third report received by the surveillance system.)
Width: 2
Type: Character
Coding: Same as REPSRCE1
Comment:

**INTERVIEW (IW)**
Definition: Indicates whether the affected individual or a third party was interviewed by surveillance staff.
Width: 1
Type: Logical
Core: No
FAQ: 1 = yes
Coding: 2= no
Comment: Affected persons should be interviewed whenever possible. The only exceptions are when the exposure is reported to be an intentional self-exposure or if the person is a minor. Third parties knowledgeable about the specific pesticide exposure event can provide useful information. Third parties include employers, pesticide applicators, farm owners, family members, and landlords.

**MEDRECORDS (MEDRECS)**
Definition: Indicates whether medical records on the affected individual were received.
Width: 1
Type: Logical
Core: No
FAQ: Coding: 1 = yes
Coding: 2= no
Comment:

**SEX (CCASESEX)**
Definition: Sex of disease or injury case
Width: 1
Core: Yes
FAQ: Type: Character
Coding: M= Male
F = Female
O = Other
U= Unknown/not stated
Comment: This is the core variable format currently specified by CDC. Hermaphrodites and transsexuals should be coded as "Other".

**DOB (DCASEDOB)**  
**Definition:** Year, month, day of birth.  
**Width:** 8  
**Type:** Date  
**Core:** No  
**FAQ:**  
**Coding:** YYYYMMDD format  
**Comment:** This is the core variable format currently specified by CDC. If birthdate is not available, an estimated birthdate should be created from the individual's age. There are no current guidelines for dealing with missing data other than leaving missing data as blank. Until standard guidelines are developed the following guidelines may be used. Cases for which both date of birth and age are missing will not be accepted into the surveillance system. The mid-point for the unknown component of the birthdate should be used for estimating date of birthdate. For example an individual known only to be born in 1933 should be coded as "19330701". If the individual is known to have been born in April of 1933 the birthdate should be coded as "19330415". If DOB is missing for children less than six months old, the date of birth field should be left blank since estimated date of birth has the potential for introducing a large degree of error.

**AGE (CCASEAGE)**  
**Definition:** Age in years  
**Width:** 5  
**Type:** Numeric with one decimal place  
**Core:** Yes  
**FAQ:**  
**Coding:** Numeric. For individuals less than 3 years old, if age is reported in months, use decimals as follows: 1 month -.1, 2 months -.2, 3 months -.3, 4 months -.4, 5 months -.5, 6 months -.6, 7 months -.7, 8 months -.8, 9 months -.9.  
**Comment:** "AGE" will be important for evaluating cases and developing intervention strategies. There was concern that if age is permitted the individuals collecting data will not bother to obtain birthdates. Due to the nature of this condition and the difficulties in tracking migrant agricultural workers who may not seek medical attention it was decided that age would be an accepted variable. The current form for this variable does not match the CDC recommended format for age. The CDC recommended format includes a field for age and a field for age type. The CDC approach was discussed at length by the states currently conducting surveillance and was rejected as too cumbersome.  
If age is a calculated field, the following hierarchy should be used to determine age:  
date of birth and date of exposure(tfirstexp). If tfirstexp not available, then:  
date of birth and date of illness onset (tonset). If tonset not available, then:  
date of birth and date of report(dreport).  

In SPIDER age is calculated automatically, and a 'basis' field is coded to indicate which reference date is used (tfirstexp, tonset or dreport). To avoid the problem of unknown age being coded as zero (newborn), if DOB is empty, age is coded as -1. If the reference dates are all empty, age is coded as -2.

**HISPANIC (CCASEHISP)**  
**Definition:** Indicator for self-identified Hispanic ethnicity  
**Width:** 1  
**Type:** Character  
**Core:** No  
**FAQ:**  
**Coding:** 1 =Yes
Comment: This is the variable format currently specified by CDC. Ethnicity reported in this system should be the self-identified ethnicity of the individual determined during case follow-up. If self-identified ethnicity is not available this variable should be coded as unknown.

**RACE (CCASERACE)**

Definition: Self-described race of reported individual

Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = American Indian, Alaskan Native
2 = Asian or Pacific Islander
3 = Black
5 = White
6 = Mixed Race
8 = Other - Use if person volunteers a category not described in the codes above or if an individual self-identifies as 'Brown', and does not indicate 'mixed Race'. (Note that this may apply to Hispanic individuals who do not consider themselves Caucasian or mixed race.)
9 = Unknown

Comment: This is the core variable format specified by CDC when this coding project was initiated. Code as unknown if self-identified information is not available. The code for "Mixed Race" was added based upon the request for such a variable. There may be new suggested guidelines for this variable in the future from CDC at which time this coding scheme may be reevaluated. Coding this as "9=Unknown" will not exclude the record from the national aggregated data.

**INDUSTRY/OCCUPATION DATA**

**WORKREL (CWORKREL)**

Definition: Indicates causal relationship between illness/injury and case's work

Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = yes
2 = possibly
3 = no
4 = unknown
5 = N/A

Comment: Indication of work-relatedness is essential for occupational health surveillance systems. If coded as "2", possibly work-related' an explanation must be provided in the narrative OCCNAR field. Operational guidelines for the determination of work-relatedness are included in Appendix A.

**OCCTITL (COCCUP)**

Definition: Occupation/job title at time of injury or exposure. This is only reported for individuals with work-related exposures.

Width: 65
Type: Character
Core: Yes
FAQ: Narrative
Comment: This narrative, which is analogous to that contained in the 1990 U.S. Census, should address the following:

What was this person's occupation or job title? (For example: registered nurse, personnel manager, farm manager - vegetable row crops, farm worker-fruit orchard, nursery worker - flower bulb sorter, nursery worker - pruner - general laborer, gardener, potato sorter, dog groomer, pest control - applicator trainee, high school teacher.) This code was discontinued in January 2007.

**OCCCODE** (CCOC)
Definition: Numeric 1990 US Census code for occupation described in OCCNAR
Width: 3
Type: Character
Core: Yes, see comments
FAQ: CODING: 1990 U.S. Census Occupation Code
Comment: U.S. Census Occupation Codes are used throughout the statistical community and have been adopted by NIOSH and NCHS for use in generating occupational health statistics. There was some discussion of whether occupational coding other than Census coding would be more appropriate. This question was raised due to the limited codes available in the census system for agricultural occupations. Census coding is the preferred coding due to the availability of denominator data. Starting in January 2007, COC2002 codes may be used in addition to, or instead of COC1990 codes.

**OCCCODE2002** (CCOC2002)
Definition: Numeric 2002 US Census code for occupation described in OCCNAR
Width: 4
Type: Character
Core: Yes, see comments
Comment: U.S. Census Occupation Codes are used throughout the statistical community and have been adopted by NIOSH and NCHS for use in generating occupational health statistics. Census coding is still the preferred coding due to the availability of denominator data. This code was added in January 2007, and may be used instead of COC1990 codes.

**OCCNAR** (COCCNAR)
Definition: Describes additional information about the occupation, industry or work-relatedness of the exposure not covered in variables in this section.
Width: 125
Type: Character
Core: No, see comments.
FAQ: CODING: Literal narrative, describing anything that would impact on interpreting the coded information. If WORKREL is coded as "2, possibly work-related" an explanation must be provided here. Indicate circumstances that complicate decision regarding whether the exposure was work related.
Comment: This narrative should address the following:

What was this person's occupation or job title? (For example: registered nurse, personnel manager, farm manager - vegetable row crops, farm worker-fruit orchard, nursery worker - flower bulb sorter, nursery worker - pruner - general laborer, gardener, potato sorter, dog groomer, pest control - applicator trainee, high school teacher.)

**IND** (CINDNARR)
Definition: Industry at time of injury or exposure
Width: 100
**INDSIC** (CSIC)
Definition: SIC Code for industry described in IND
Width: 4
Type: Character
Core: Yes, see comments
FAQ: 
Coding: 1987 Standard Industrial Classification (SIC) code
Comment: The SIC is an outdated Office of Management and Budget (OMB) coding system for type of industry. OMB replaced this coding system with the North American Industry Classification System (NAICS). Please note that Census occupation coding rules require use of the Census Industry Code, which is easily converted from the SIC (using the "Instruction Manual Part 19" pages 79-81 [Hyattsville, MD: US DHHS; 1997]) or NAICS code. **At least one of the coding systems for industry must be used for all occupational case reports.**

**INDCIC** (CCIC)
Definition: 1990 Census Industry Classification System industry code
Width: 3
Type: Character
Core: Yes, see comments
FAQ: 
Coding: See the Alphabetical Index of Industries and Occupations for U.S. Census 1990.
Comment: **At least one of the coding systems for industry must be used for all occupational case reports.**

**NAICS** (CNAICS)
Definition: North American Industry Classification System industry code
Width: 6
Type: Character
Core: Yes, see comments
FAQ: 
Comment: This system is the most recent form of industry coding shared by the USA, Canada and Mexico. It is a production-oriented, process-based system for coding industry. Some states may choose to continue using a combination of SIC and NAICS coding for particular industries. Not all SIC codes can be easily derived from NAICS codes. This was changed from NAICS 1997 to NAICS 2002 in January 2007. **At least one of the coding systems for industry must be used for all occupational case reports.**

**INDCIC2002** (CCIC2002)
Definition: 2002 Census Industry Classification System industry code
Width: 4
Type: Character
Core: Yes, see comments
FAQ: 
Coding: See the NIOSH Industry and Occupation Computerized Coding System (NIOCCS) [http://wwwn.cdc.gov/niosh-nioccs/](http://wwwn.cdc.gov/niosh-nioccs/)
Comment: NIOSH prefers that all states provide this code. **At least one of the coding systems for industry must be used for all occupational case reports.**

**EXPOSURE DESCRIPTIONS**

The following variables characterize the exposure. States are also asked to complete a short narrative that adds pertinent information and describes any unusual circumstances associated with the exposure.

**TYPE of EXPOSURE**

The following variables describe the nature of the exposure. More than one of these variables may be coded as "1=yes" if the individual was exposed to the pesticide via more than one mode of exposure. However, efforts should be made to only code the type(s) of exposure that are most likely linked to the illness and injury. It does not matter if the case involves a misapplication; code the type of exposure according to the guidelines below.

**DRIFT (LDRIFT)**

Definition: Indicates whether the individual was exposed via the movement of pesticides away from the treatment site. The pesticide spray, mist, fumes, or odor are carried from the target site by air.

- **Width:** 1
- **Type:** Logical
- **Core:** No
- **FAQ:**
- **Coding:**
  - 1 = yes
  - 2 = no
- **Comment:** The default should be set to "2" for this variable. This variable must be coded as "2" if **TYPEUNK** is coded as "1". Pesticide material blown back onto the applicator during the application process is coded as **TARGETED**. Use the Event Narrative to include information that will assist in determining whether this meets the EPA definition of drift vs volatilization. Include answers to as many of these questions as are known. Did the exposed person see the application? Did the exposed person feel the application? Did the exposed person smell the application? What was the duration of the application? Include start and end times when known. What was the duration of the work/exposure time? Include work/exposure start and end times when known. If exposure was not the same day, how many days were there between the application and the exposure? When was sign/symptom onset in relationship to the application?

**DRIFTDIST (LDDIST)**

Definition: The distance in feet that the pesticide moved from the targeted area.

- **Width:** 4
- **Type:** Numeric
- **Core:** No
- **FAQ:**
- **Coding:**
  - Number of feet pesticide was known to have drifted
  - If distance is given in another unit, calculate into feet before coding
  - If distance is given in a range, code the mid-point
  - 9999 = Unknown
- **Comment:** The actual distance of drift will be useful information for educational and regulatory purposes.

**DISTBASIS (LDBASIS)**

Definition: The basis for determining the reported drift distance

- **Width:** 1
- **Type:** Character
- **Core:** No
- **FAQ:**
- **Coding:**
  - 1 = Residue/sampling results
2 = Worker report/interview
3 = Corroborated by manager/crew leader
4 = Corroborated by other witness
5 = Corroborated by application records
6 = Corroborated by Google Maps
7 = Other basis

Comment: More than one basis may be used in determining the distance the pesticide drifted. For example the targeted site is corroborated by the application record and the distance from the targeted site determined by worker reports and Google Maps.

**TARGETED (LTARGETED)**
Definition: The individual was exposed to an application of a pesticide material released at the target site, and not carried from the target site by air. The pesticide may be any formulation type (granular dust, aerosol, liquid, etc.). Hand application by any method is included as well as the use of all forms of application equipment. Exposure to the material can be by direct projection, ricochet, blow back by wind onto the applicator during the application process, or airborne exposure to anyone moving through an area being actively treated.

Width: 1
Type: Logical
Core: No
FAQ: Coding: 1 = yes
2 = no

Comment: The default should be set to "2" for this variable. This variable must be coded as "2" if TYPEUNK is coded as "1". Note that TARGETED includes: 1) situations where the target site may be a misapplication or an error (e.g., spraying the wrong field, accidentally spraying oneself with an insecticide); 2) situations where an individual was exposed to fumes while mixing or loading pesticides, including mixing bleach and ammonia (which produces chloramine gas); and 3) situations where an individual was exposed while sanitizing dishes or disinfecting swimming pools. Finally, an earlier version of this variable was called SPRAY, but use of SPRAY was discontinued on January 1, 2006.

**SPRAY (LSPRAY)**
Definition: Individual exposed to pesticide material propelled by the application or mixing/loading equipment. The pesticide may be any formulation type (granular dust, aerosol, liquid, etc.). Exposure to the material can be by direct projection or by ricochet. Note that pesticide material blown back onto the applicator during the application process or exposure to the applicator while moving through the treated area is coded as SPRAY.

Width: 1
Type: Logical
Core: No
FAQ: Coding: 1 = yes
2 = no

Comment: The default should be set to "2" for this variable. This variable must be coded as "2" if TYPEUNK is coded as "1".

NOTE: This variable is replaced by TARGETED effective January 1, 2006, and therefore should be omitted for data collected after that date.

**INDOORAIR (LINDOORAIR)**
Definition: The individual was exposed via indoor air contamination (this includes residential, commercial and greenhouse indoor air).

Width: 1
Type: Logical
SURFACE (LSURFACE)
Definition: The individual was exposed via contact with pesticide residues on treated surface (plant material, carpets, treated animal) or entry into an outdoor treated area. Any contact or secondary contact with residues is coded as SURFACE. (An example of secondary contact is person touches treated plant, and then touches self.) The treated surface may include contact with the individual’s own clothing or body part that was treated (e.g. applied pesticide spray to back of forearms and hands, and then rubbed eyes with back of hand.)

LEAKSPILL (LLEAKSPILL)
Definition: The individual was exposed to a leak or spill of pesticide material from any cause. The leak or spill could have occurred at the time of exposure (e.g., an applicator exposed to pesticides from a leaking backpack sprayer) or prior to the exposure (e.g., emergency workers exposed to a pesticide spilled during a truck accident; the accident occurred hours before the exposure).

CONTACT (LCONTACT)
Definition: The individual was exposed via other direct contact not included in SPRAY or SURFACE. This includes: 1) Contact made during an application or mixing/loading operation where the material is not propelled by the equipment; 2) Expected direct contact during use (e.g. washing dishes in a disinfectant solution); 3) Leaks, spills, etc. not related to an application, including during emergency response; 4) handling a pesticide delivery device (e.g., dispenser, trap, pheromone strip).

NOTE: This variable is replaced by LEAKSPILL and TYPEOTH effective January 1, 2006, and therefore should be omitted for data collected after that date.
TYPEOTH (LOTHER)
Definition: Indicates if the type of exposure does not fit into any of the categories of exposure described in the previous five variables.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2 = no
Comment: This variable must be coded as "2" if TYPEUNK is coded as "1". Describe the type of exposure in EXPOCOMM.

TYPEUNK (LTYPEUNK)
Definition: Indicates if the type of exposure is unknown.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. This variable must be coded as "2" if any of the five preceding variables are coded as "1". Try to avoid unknowns. For example, ask “How do you think you were exposed?” during case interviews. However, if it is truly unknown how the exposure occurred, then code as unknown. Do not assume, speculate or opine.

ROUTE of EXPOSURE
The following six variables describe the route(s) of exposure

DERMAL (LDERMAL)
Definition: Indicates whether the individual was exposed to the pesticide by the dermal route of exposure.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether there was dermal exposure code as "2". This variable must be coded as "2" if ROUTEUNK is coded as "1".

INHALE (LINHALE)
Definition: Indicates whether the individual was exposed to the pesticide by inhalation.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether there was an inhalation exposure code as "2". This variable must be coded as "2" if ROUTEUNK is coded as "1".

INGESTION (LINGESTION)
Definition: Indicates whether the individual ingested pesticide.
Width: 1
INJECTION (LINJECTION)
Definition: Indicates whether the individual was exposed to the pesticide by injection.
Width: 1
Type: Logical
Core: No
FAQ: No
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether there was an exposure by injection code as "2". This variable must be coded as "2" if ROUTEUNK is coded as "1".

OCULAR (LOCCULAR)
Definition: Indicates whether the individual was exposed to the pesticide by the splash, spill or spray to the eye.
Width: 1
Type: Logical
Core: No
FAQ: No
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether ocular exposure occurred code as "2". This variable must be coded as "2" if ROUTEUNK is coded as "1".

ROUTEUNK (LROUTEUNK)
Definition: Indicates if the type of exposure is unknown.
Width: 1
Type: Logical
Core: No
FAQ: No
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. This variable must be coded as "2" if any of the five preceding variables are coded as "1".

OTHER EXPOSURE INFORMATION
The following variables describe other information collected related to the exposure.

INTNEXPO (CINTENT)
Definition: Indicates whether the pesticide exposure was intentional or unintentional.
Width: 1
Type: Character
Core: No
FAQ: No
Coding: 1 = Yes, suspected intentional
2 = No, unintentional
9 = Unknown

Comment: The yes category should be used only when the intentional exposure was for the purpose of suicide, homicide or other situation where the intent was to cause harm to oneself or another person. The unknown category should be used primarily for ingestion cases where the intention of the individual is unclear. If the intention is not clearly documented it should be coded as unknown. This also applies to deaths where the circumstances are unclear with regards to the intent of the deceased individual. Illness caused by ingesting commercial food crops or products contaminated with pesticides should be coded as unintentional unless there is specific evidence of product tampering for the purpose of causing harm.

**ACTEXPIND (CACTIVITY)**
Definition: Activity of exposed individual at time of exposure.
Width: 2
Type: Character
Core: Yes
FAQ: B.5., B.6. (See Appendix C)
Coding:

- 01 = Applying pesticide
- 02 = Mixing/loading pesticide
- 03 = Transport or disposal of pesticide. Transport includes activities involved with movement of pesticide or pesticide waste by vehicle or hand during the time interval from after the product is loaded (into application equipment, or truck, railcar or other transport vehicle) until it reaches the destination for unloading, application, or disposal. Note that activities involving unloading, stocking retail shelves, etc. fall into code 08. The activity of loading pesticides falls into code 02.
- 04 = Repair or maintenance of pesticide application equipment
- 05 = Any combination of activities 01-04
- 06 = Involved in manufacture or formulation of pesticide
- 07 = Emergency response
- 08 = Routine work activity not involved with pesticide application (includes exposure to field residue)
- 09 = Routine indoor living activities not involved with pesticide application
- 10 = Routine outdoor living activities not involved with pesticide application
- 11 = Application to self or another human of a pesticide intended to be used on human skin hair or clothing (code added effective 1/1/2006. Prior to that date, guidance indicated that these exposures should be coded as normal working or living activities [i.e. codes 08 or 09].)
- 98 = Not applicable
- 99 = Unknown

Comment: This variable will assist states and other users of the data in determining whether pesticide-related illness is associated with handling pesticide products, treated material, or due to incidental contact not directly associated with the actual application of the pesticide. This information will be useful in developing intervention strategies. Note that if a person was mixing/loading or applying but was exposed while taking a short break or while stopping their activity to talk to a co-worker during or after the application, this is still considered mixing/loading or applying pesticides. Such activities should NOT be coded 08, “routine work activity not involved with pesticide application.”

**PPE (CPPE)**
Definition: Describes whether personal protective equipment was used by the exposed individual, and whether the surveillance system investigation indicates PPE was required by rule or law.
Width: 1
Type: Character
Core: Yes
FAQ: B.9. (See Appendix C)
Coding:

- 1 = PPE worn and all or some PPE worn appeared to be required by label or rule
- 2 = PPE worn by choice, apparently none was required by label or rule
- 3 = PPE worn, undetermined if required by label or rule
- 4 = PPE not worn, although some PPE appeared to be required by rule or law
- 5 = PPE not worn, undetermined if required by label or rule
6 = No, PPE not worn, and PPE did not appear to be required by rule or law
8 = Not applicable
9 = Unknown

Comment: This and the related variables will allow tracking of information on factors that may contribute to exposure and may be useful for developing intervention strategies. The language of this variable is structured to acknowledge that the judgment of whether PPE would be required is based upon the surveillance program investigation, and may not reflect the assessment by an enforcement agency.

Code as "not applicable" for all purposeful exposures, and for accidental and incidental exposures where an individual would not have expected an exposure and therefore PPE is not a consideration. This includes all purposeful and accidental ingestion exposures, and bystander exposures during spills or applications.

State programs that do not wish to record judgments regarding whether PPE was required should use the codes "3" and "5". Comments that will clarify whether the PPE appeared to be appropriate, worn correctly, maintained appropriately, etc. should be included in EXPOCOMM.

This code was replaced with PPEANY in January 2010.

**PPE (PPEANY)**
Definition: Describes whether personal protective equipment was used by the exposed individual
Width: 1
Type: Character
Core: Yes
FAQ: B.10. (See Appendix C)
Coding: 1 = yes, PPE was worn
2 = no, PPE was not worn
8 = Not applicable
9 = Unknown
Comment: This and the related PPE and contributing factor (p-code) variables will allow tracking of information on factors that may contribute to exposure and may be useful for developing intervention strategies. This variable included information about whether PPE was required until January 2010 when it was simplified to just whether PPE was used.

Comments that will clarify whether the PPE appeared to be appropriate, worn correctly, maintained appropriately, etc. should be included in EXPOCOMM, VOTHER, VIOLCOM, and the contributing factor codes (PNARR and PCODE) that were added in January 2009.

**PPE 1-9**
Definition: The following PPE variables describe the types of PPE used by the exposed individual at time of exposure if CPPE is coded as "1", "2" or "3".
Width: 1
Type: Character
Core: No
FAQ: 
Coding: 1 = Yes
2 = No
8 = Not applicable
9 = Unknown

PPE1 (CRESP_SA)  Respirator (Supplied air) (CRESP_SA)
PPE2 (CRESP)  Respirator (Half Face, Full Face, PAPR)
PPE3 (CDUSTMASK)  Dust mask/disposable respirator
PPE4 (CBOOTS)  Rubber/chemically resistant boots
PPE5 (CNATGLOVES)  Gloves (Cloth or Leather)
PPE6 (CSYNGLOVES) Gloves (Rubber or Synthetic)
PPE7 (CCGOGGLES) Chemical Goggles/ Face shield
PPE8 (CCLOTHING) Chemically resistant clothing (rubber apron, Tyvek, raingear)
PPE9 (CENGCONT) Engineering Controls

Comment: If CPPE is coded as "8=not applicable" or "9=unknown" then all of the variables PPE1-9 should be coded in the same manner as CPPE. These codes were replaced with PPETYPE codes in January 2010.

PPETYPE 1-25
Definition: The following PPE variables describe the types of PPE used by the exposed individual at time of exposure if PPEANY is coded as "1".

Width: 1
Type: Character
Core: No
FAQ:
Coding: 1 = Yes
2 = No
8 = Not applicable
9 = Unknown

PPETYPE1 (CRESP_SA) Respirator (Supplied Air/SCBA)
PPETYPE2 (CRESP_ORG) Respirator (Organic Vapor Respirator)
PPETYPE3 (CRESP_PART) Respirator (Particulate Respirator including N95 and N99)
PPETYPE4 (CDUSTMASK) Dust mask/bandana
PPETYPE5 (CRESP_OTH) Other respiratory protection
PPETYPE6 (CEYE_FFR) Full Face Respirator
PPETYPE7 (CEYE_FS) Face shield
PPETYPE8 (CEYE_G) Chemical Goggles
PPETYPE9 (CEYE_SG) Safety Glasses
PPETYPE10 (CEYE_OTH) Other eye protection
PPETYPE11 (CGLOVES_SYN) Gloves (Chemical resistant gloves)
PPETYPE12 (CGLOVES_NAT) Gloves (Cloth or Leather)
PPETYPE13 (CGLOVES_OTH) Other hand protection
PPETYPE14 (CCLOTH_SHIRT) Long Sleeve Shirt
PPETYPE15 (CCLOTH_PANT) Long Pants
PPETYPE16 (CCLOTH_COVER) Coveralls
PPETYPE17 (CCLOTH_CHEMS) Chemical Resistant Suits
PPETYPE18 (CCLOTH_CHEMA) Chemical Resistant Apron
PPETYPE19 (CBOOTS) Rubber/chemically resistant boots
PPETYPE20 (CHEMH) Chemical Resistant Headgear
PPETYPE21 (CHEAD) Non-Chemical Resistant Headgear
PPETYPE22 (CCLOTHING) Other clothing/headgear protection
PPETYPE23 (CENG_CLOSE) Engineering Controls (Closed System)
PPETYPE24 (CENG_CAB) Engineering Controls (Enclosed Cab)
PPETYPE25 (CENG_OTH) Other Engineering Controls

Comment: If PPEANY is coded as "2=PPE not worn", 8 = Not applicable, or "9=unknown" then all of the variables PPETYPE1-25 should be coded in the same manner as PPEANY. This list was expanded from the 9 categories of PPE1-9 to the 25 categories in PPETYPE in January 2010.

EQUIPMEN (CEQUIPMENT)
Definition: Describes the type of equipment or application method used for the application. This should be coded regardless of whether it was used by the exposed individual or another individual who performed the pesticide application.

Width: 2
Type: Character
Core: No
FAQ: 
Coding: 
01 = aerial application equipment (fixed wing or helicopter)
02 = chemigation (application through irrigation system)
03 = pressurized can - This includes pesticides that are combined with an inert compressed gas propellant in a disposable self-dispensing container. The container may release the pesticide as a spray, mist or fog. These aerosol cans have triggers that permit intermittent use of the product. These products are available for use by homeowners as well as professional pesticide applicators. This excludes total release foggers; they should be coded 16, as of January 1, 2009.
04 = aerosol generator or fogger (thermal or cold) - Includes equipment designed to disperse pesticide as small airborne droplets into confined spaces such as greenhouses and warehouses or for outdoor control of mosquitoes and other public health or nuisance insects. These units are available as hand carried or backpack ultra-low volume (ULV) cold or thermal foggers and the more commonly used vehicle mounted cold or thermal foggers. Greenhouse applications may include stationary heated units for thermal foggng of the greenhouse.
05 = soil injector (Any mechanism used to inject fumigant or other pesticide material into soil, e.g. chisel cultivator, blade or shovel, sweep cultivator shovels, planter shoes, plow. This excludes any cultivator used to incorporate surface applied fumigant into soil). Soil injectors usually have a tube down the back of the shank that places the pesticide a foot or more into the soil.
06 = high pressure fumigator (this includes high pressure fumigant applications other than soil injection) - metered application from pressurized gas cylinder.
07 = handheld granular or dust applicator (squeeze bulb, bellows, tube, shaker, sliding tube, or fan powered by a hand crank). This excludes power dusters, which should be coded under sprayers.
08 = spray line, hand held - this includes hose end sprayers, hand held lines attached to powered spray tanks.
09 = sprayer, backpack (this includes both powered and manual backpack spray units)
10 = trigger pump, push-pull, or compressed air hand sprayer - these are handheld units used for spot spraying.  

Trigger pumps are usually plastic bottles with a built in hand trigger to disperse liquid pesticide. Homeowners and professional applicators use these for indoor plants, pests and small areas.
Push-pull sprayers are operated by a hand operated plunger that uses air and vacuum pressure to expel pesticide from a small (typically less than 1 quart) attached tank unit.
Compressed air hand sprayers - these are small volume (1-5 gallon) tanks with manual pumps.
11 = low-pressure ground sprayer not otherwise specified - includes sprayers attached to or pulled by tractor or ATV. Includes common boom sprayers, electrostatic sprayers, and ULV sprayers. High pressure sprayers such as airblast sprayers are excluded and should be coded 17, as of January 1, 2009.
12 = manual placement (e.g. gopher bomb, bait station, pellets, hand toss of briquette, placement of fumigant pellet packs), this also should be used to code for circumstances where pesticide is poured directly onto a target surface from a container.
13 = dip tank or tray (includes dipping of animals, produce, bulbs, plant material etc.)
14 = more than one type of application equipment used
15 = This code is deliberately left blank. Prior to 2016 it was the code for “other”.
16 = total release fogger or aerosol bomb - Aerosol foggers or bombs are single use disposable units designed to completely empty their contents in a single use. This code was added January 1, 2009 to separate out foggers from other aerosol cans.
17 = high pressure ground sprayers - includes high pressure hydraulic spraying such as airblast sprayers and tower sprayers. This code was added January 1, 2009.
18 = ozone generator. This code was added in January 2016 to capture ozone generation for disinfection.
19 = other chemical generator. This code was added in January 2016.
20 = heat generator. This code was added in January 2016.
97 = other, this includes all other equipment such as non-handheld mechanical granule applicators, etc. This code was added in January 2016 to replace code 15.98 = not applicable
99 = unknown
Comment: Capturing the specifics of application equipment used is difficult unless a field investigation is conducted. The categories selected for coding included those types of equipment that would be easily recognized by descriptions and which were judged important for developing possible intervention strategies. For more detailed descriptions and pictures of equipment a good reference is Chapter 10 Pesticide Application Equipment, In: The Safe and Effective Use of Pesticides, University of California Statewide Integrated Pest Management Project, Division of Agriculture and Natural Resources, Publication 3324, Oakland, CA, 1988, p. 273-322.

**APPLICTR (CAPPSUP)**

**Definition:** Indicates the licensing and supervision of the individual who performed the application.

**Width:** 1

**Type:** Character

**Core:** No

**FAQ:** B.9. (See Appendix C)

**Coding:**
- 1 = Licensed applicator
- 2 = Unlicensed individual, under constant direct (onsite) supervision of licensed applicator during application
- 3 = Unlicensed individual, under indirect or intermittent supervision of licensed applicator during application - This code refers to individuals who are operating under the loose supervision of a licensed applicator who may be at a different location. These individuals may be trainees, or workers who have been designated to apply pesticides by their employer.
- 4 = Unlicensed, adult not under supervision of licensed applicator during application - Use this code for a homeowner applying pesticides. An unlicensed individual performing an application without supervision of a licensed applicator as an incidental part of their job should also be coded "4". (For example: an apartment maintenance worker asked to spray the grounds or surfaces in an apartment complex.)
- 5 = Unlicensed child (16 years old or younger) not under supervision of licensed applicator during application (this includes situations where a license may not be required)
- 8 = Not applicable
- 9 = Unknown

**Comment:** This variable can provide important information for interventions.

**APPTARGT (CTARGET)**

**Definition:** This variable describes the target surface for the pesticide application.

**Width:** 3

**Type:** Character

**Core:** No

**FAQ:** B.2., B.5., B.7., B.8. (See Appendix C)

**Coding:**
- 010 = Landscape/ornamental (includes lawns, flower gardens, ornamental plants)
- 020 = Forest trees, forest lands
- 031 = Veterinary/livestock - Livestock includes all agricultural animals such as dairy animals, poultry, meat animals, fur and wool bearing animals.
- 032 = Veterinary/domestic animal
- 041 = Building structure - this includes applications to the building structure including wall void injection, treatment of structural building members to eradicate pests, building perimeter treatments, crack and crevice treatment as well as treatment of air conditioning systems and heating ducts. If the application involves any combination of codes "041-043" use the numerically higher code.
- 042 = Building surface - this includes applications to building surfaces such as spraying of carpets, flea foggers, interior area surface sprays in living/working areas other than crack and crevice, and cleaning floors, bathrooms, toilets, kitchenware and other building surfaces. If the application involves any combination of codes "041-043" use the numerically higher code. NOTE: Prior to 2015, it was advised to include application to toilets under code “850.”
- 043 = Building space treatment - this code includes structural applications to residences or commercial buildings using fumigants. Note that greenhouse fumigation and treatment with thermal fogs should be
coding according to the actual target crop. If the application involves any combination of codes "041-043" use the numerically higher code.
050 = Undesired plant (the plant is the target pest and the only target of the application). This code should be used for spot weed control applications. Indicate the specific crop or commodity in the Exposure Narrative or the CROP variable.
060 = Aquatic excluding pools (pond, stream, lake, irrigation canal, waste pond)
061 = Pools (swimming pools, Jacuzzis, whirlpools, hot tubs, and fountains) [code added effective 1/1/2006]
070 = Soil (pre-plant application to soil such as fumigation, when no crop is present) Indicate the specific crop or commodity in the Exposure Narrative and CROP variable.
080 = Wood product - Includes railroad ties, utility poles and materials for fences, decks, wood landscape structures, bulwarks, pilings outdoor wood furniture pre and post-consumer purchase.
100 = Fruit Crops
101 = Small fruits
   [blackberry, boysenberry, dewberry, loganberry, raspberry, youngberry, blueberry cranberry, currant, elderberry, gooseberry, grapes, huckleberry, strawberry, bushberries, serviceberry, mulberry]
110 = Tree fruits
111 = Citrus fruits
   [citron, grapefruit kumquat, lemon, lime, orange, tangelo, tangerine, other citrus hybrids, pummelo]
112= Tree Nuts
   [almond, brazil nuts, cashew, chestnut, filbert (hazelnut), hickory nut, macadamia nut (bushnut), pecan, walnut, butternut, pistachio]
113 = Pome fruits
   [apple, crabapple pear, quince, mayhaw (hawthorn)]
114 = Stone Fruits
   [apricot, cherry, nectarine, peach, plum, prune]
120 = Subtropical and miscellaneous fruits
   [avocado, banana, coconut, date, fig, guava, mango, loquat, olive, papaya, pawpaw, persimmon, pineapple, passion fruit, pomegranate, plantain, litchee nut, kiwifruit, caprifig, acerola, gingko nut, mamey, surinam cherry, soursop, sugar apple (custard apple), breadfruit, prickly pear, carambola, cherimoya, longan, mamaladebox, granadilla, sapota, star apple, Japanese plum, sapodilla]
200 = Beverage crops
   [cocoa, coffee, tea, mint, cola, chicory]
300 = Flavoring and spice crops
   [angelica, anise, balm, basil, caraway, cassia, catnip, celery, cinnamon, cloves, coriander, cumin, dill, elecampane, fennel, fenugreek, ginger, hops, horehound, horseradish, juniper, lavender, licorice, marjoram/oregano, mint/peppermint / spearmint, mustard, nutmeg, pennyroyal, pepper(black/white/ chili/(paprika type), rosemary, rue, safflower, sage, savory, sesame, bay/sweet bay, tamarind, tansy, tarragon, thyme, turmeric, vanilla, wintergreen, wormwood, allspice, poppy, chamomile, costmary, hyssop, marigold, nasturtium, woodruff, valerian]
400 = Vegetable Crops
410 = Curcurbit Vegetables
   [melons, gourd, cucumber, squash (all), okra, gherkin, chayote]
420 = Fruiting Vegetables
   [eggplant, pepper, pimento, tomato, gooseberry, pepino, tomatillo]
430 = Leafy vegetables
   [beets, celery, chicory, broccoli, brussel sprouts, cabbage, caulifower, collards, kale, kohlriabi, corn salad, dandelion, endive (escarole), fennel, cress, artichoke, lettuce (all varieties), mustard, parsley, rhubarb, spinach, turnip, watercress, prickly pear, cactus pads, grape leaves, bamboo shoots, broccoli raab, mustard cabbage (puk choi), chervil, roquette (arugula), dock, peppergrass]
440 = Root and Tuber Vegetables
[beets, carrot (including tops), celeriac, chive, taro, garlic, horseradish, Jerusalem
artichoke, leek, onion (including green, spring and scallions), parsnip, potato, radish (all
types), rutabaga, salsify, shallot, sweet potato, turnip, yam, lotus root, manioc (cassava),
arrowroot, yautia, water chestnut, chufa (ground almond)]
450 = Seed and Pod Vegetables
[beans (fresh and dried all types), peas (fresh and dried all types), bean sprouts (all types),
carob]
460 = Miscellaneous vegetables
[algae, seaweed, asparagus, mushrooms]
500 = Grains, Grasses and Fiber Crops
501 = Fiber crops
[cotton, flax, hemp, kenaf, ramie, abaca, broomcorn]
510 = Grasses for Forage, Fodder Hay and Silage when intended use is forage, fodder hay and
silage.
[millet, sorghum, corn, oats wheat, barley, rye, sudangrass, pasture, bermudagrass,
bluegrass, timothy, rice, millet, canarygrass, grasses for bird seed]
520 = Legumes and Related Crops for Forage, Fodder Hay and Silage when intended use is
forage, fodder hay and silage.
[alfalfa, beans, clover, cotton, lespedeza, peanuts, peas (including vines), sugar beets
(including tops), vetch, trefoil, sainfoin, soybeans, carrot tops, carob, rape, kudzu, lupine,
buckwheat]
530 = Cereal Grain Crops
[barley, corn, oats, rice, rye, sorghum, wheat, millet (proso, broomcorn), triticale, wild
rice, teosinte]
540 = Sugar Crops
[honeycomb, sugar beet, sugarcane, sugar maple, sorghum]
550 = Miscellaneous Field Crops
[tobacco, popcorn, pyrethrum, sesame, pine nuts, grasses for seed and non-forage use]
600 = Oil Crops
[castor bean, field corn, cotton, flax, mint/ peppermint/ spearmint, peanuts, safflower,
sesame, soybeans, sunflower, tung, wormseed, avocado, coconut, olive, rape, jojoba,
palm]
601 = Application to seeds (seed treatment)
650 = Crops that cross categories 90-600
700 = Humans
701 = Skin and/or hair
702 = Clothing
703 = Skin and/or hair and clothing
800 = Bait for rodent, bird or predator
801 = community-wide application target (this should only be used to indicate public pest control
activities aimed at eradicating or controlling, a public health, nuisance, or agricultural pest) Make sure
to code PURPOSE and SPECPEST if this code is used. Code added effective January 1, 2003.
850 = Other
- mixed crop and non-crop areas
- mammal feeding and nesting areas (if mammals are the target pest)
- industrial or food processing equipment
- boats and docks antifouling treatments
- disinfection of medical equipment and materials in beauty and barber shops, spas,
morgues, mortuaries and funeral homes
- other special target sites not otherwise specified
998 = N/A - application not involved
999 = unknown
Comment: This variable provides users with information on patterns of illness associated with particular crops,
structures and other target sites for applications. Disinfecting toilets was moved from 850=“Other” to
042=“Building surface” in January 2016. The application target is the target surface that the applicator intended to treat, and may not necessarily be a target approved by the pesticide product label. This information will be useful for developing intervention strategies. The coding scheme for this variable is adapted from EPA and USDA coding. It was suggested that other coding schemes be evaluated, or that definitions be provided. There are many coding schemes for this type of information. This one was selected as it allows comparability between categories currently used to evaluate crop specific pesticide uses. Information coded in this field should be at the most specific level available.

**APPSITE (CEVENTSITE)**

**Definition:** Location where the application or event (e.g., spill, transport accident, fire) associated with the exposure took place.

**Width:** 2

**Type:** Character

**Core:** Yes

**FAQ:**

**Coding:**

01-09 = Agricultural (including outbuildings other than farm residence or labor housing)

01 = farm (all farms, orchard crop production facility excluding nursery, livestock and forest)

02 = nursery (Include production nurseries. Note that retail nurseries, yard and garden centers are coded under 41)

03 = forest

04 = livestock and animal specialty production (includes all livestock production, including dairy, poultry and egg farms, horse farms, game farms, fur production farms, worm farms, pet breeding farms, apiaries and aquaculture facilities)

05 = greenhouse

09 = other non-production agricultural processing facility (this includes fruit and vegetable packing facilities, other post-harvest processing facilities such as cotton ginning. Refer to code 32 for farm product storage facilities)

10 - 19 = Private Residence (including grounds and outbuildings)

10 = single family home

11 = mobile home/trailer

12 = multi-unit housing (apts., multi-plexes) Include duplexes and residential hotels renting rooms on a monthly basis in this category.

13 = labor housing

19 = Private residence, type not specified

20 - 29 = Institutions

20 = residential institution (dorms, homeless shelters, nursing homes)

21 = school

22 = day care facility (including facility in private residence)

23 = prison

24 = hospital

29 = other institution

30 - 39 = Manufacturing

30 = pesticide manufacturing/formulation facility

31 = industrial facility

32 = farm product warehousing and storage (grain storage elevators, cold storage facilities) [Note silos on farm or livestock production facilities should be coded under codes 01 or 04]

33 = food manufacturing - includes processing of animals, fruits, grains and vegetables into food products for sale, including, slaughtering, canning, pickling, freezing, dehydrating, milling, and baking.

39 = other manufacturing facility

40- 49 = Non-manufacturing commercial facilities

40 = office/business (non-retail, non-industrial)

41 = retail establishment (include yard and garden centers, florists, retail nurseries)
42 = service establishment (include hotels (rented out hourly, daily or weekly), health clubs, other facilities that usually fall into service industry and are not included in other specific codes for this variable)
43 = Pet care services and veterinary facilities including animal boarding facilities (horse boarding, kennels, groomers, etc., animal pounds, animal training and showing facilities) [some states may choose to include some of these in analysis of agricultural exposures based upon SIC, CIC or NAICS coding]
50 - 60 = Other
  50 = road /rail
  51 = right-of-way for road, rail or utility
  52 = park
  53 = golf course
  54 = private vehicle
  55 = public transportation vehicle
  56 = cemetery
  59 = other
  60 = emergency response vehicle
70= More than one site
98 = not applicable
99 = unknown

Comment: Code APPSITE even if there wasn’t an application. APPSITE is intended to capture the location of the application or the event where the release took place. Note that exposure to individuals in a private residence that also functions as a day care facility should be coded as "22". Individuals exposed in a home office space in their own private residence should be coded with the appropriate code in the range of "10-13". All other occupational exposures linked to a business located within or attached to a private residence should be coded according to the type of business described in codes "30-49". For exposures related to pools the location of event/application should reflect where the pool (Jacuzzi, whirlpool, hot tub, or fountain) is located. For example, a pool located at an individual’s home should be coded as 10 (single family home), a Jacuzzi at a health club or hotel should be coded as 42 (service establishment) and a pool located at high school should be coded as 21 (schools). An event involving exposure to a Jacuzzi or whirlpool at a medical office, such as a physical therapist’s office, would be coded as 42 (service establishment).

CASESITE (CSITE)
Definition: Description of the type of location where the exposed individual was when they were exposed.
Width: 2
Type: Character
Core: Yes
FAQ: Coding: See APPSITE Codes
Comment: This should be coded as "98 not applicable", if the individual was located at the site of application or pesticide release when exposed. If the individual was at different physical location, but which is the same type as the location of application, this should be coded similarly. (Example: If a farmworker was exposed at a neighboring farm that boarded the farm location where the actual application was performed then both APPSITE and CASESITE should be coded "01=farm". If the farmworker was exposed at the same farm where the application occurred, APPSITE should be coded "01=farm", and CASESITE should be coded "98 not applicable".) This variable will allow systems to determine whether the exposed individual was at the site of the event or application, as well as which locations are associated with events that result in exposure on and off-site.

PURPOSE (CPURPOSE)
Definition: The purpose for community-wide target applications.
Type : Character
Width: 1
Core: Yes
FAQ:
Coding: 1 = Agricultural pest eradication
2 = Public health pest control or eradication
8 = NA
9 = Unknown
Comment: Default code should be set to ‘8=NA’ and the variable should only be coded if APPTARGT is coded 801.

SPECPEST (CSPECPEST)
Definition: Specific pest target for community-wide target applications (code 801 under APPTARGT).
Type Character
Width 3
Core: Yes
FAQ:
Coding: 001 = Mosquito (use only for applications not associated with a disease outbreak, otherwise code under the disease (codes 000-099))
002 = West Nile virus (outbreak only)
003 = St. Louis Encephalitis (outbreak only)
004 = Western Equine Encephalitis (outbreak only)
005 = Dengue fever (outbreak only)
006 = La Cross Encephalitis (outbreak only)
007 = Eastern Equine Encephalitis (outbreak only)
100 = Boll weevil
101 = Gypsy moth (Asian or European)
102 = Fruit fly (Mediterranean, Mexican, Oriental, Olive, etc.)
103 = Japanese Beetle
104 = Imported Fire Ant (Red or Black)
105 = Asian Longhorn Beetle
106 = Emerald Ash Borer
107 = Grain fungal diseases (e.g. black stem rust)
108 = Grasshopper/Mormon Cricket
850 = Other pest target
888 = Default if state chooses not to code this variable.
996 = Multiple pests
998 = Not applicable (APPTARGT not = 801)
999 = Unknown
Comments: A disease outbreak is characterized by the presence of ill individuals or animals in the community at a level that meets the community’s threshold for pesticide application. Other thresholds used to determine when pesticide application will occur do not constitute an ‘outbreak’ (i.e. monitoring data from sentinel chicken flocks, biting counts, etc.) If a pest is thought to be significant and new code is desired contact NIOSH-SENSOR Pesticide listserv to add new code. The initial default should be set to 998 until 801 is entered for the variable APPTARGT. Once 801 is entered under APPTARGT, the default for SPECPEST should be 888.

CROP (CCROP)
Definition: This variable describes the crop or commodity involved when the crop is not the application target (see comments for clarification).
Width: 4
Type: Character
Core: No
FAQ: (Note that specific crop coding available by using the fourth character in the field is optional)
Coding: 0100 = landscape/ornamental
0101 = lawns
0102 = flower gardens, not commercial
0103 = ornamental plants, not nursery
0104 = any combination of 0101-0103
0105 = golf course turf
0120 = nursery stock [ornamental plants, seedlings (including forestry), trees, flowers grown at a
nursery (not retail) Note that specific crops may be coded using 0121-0199 for single crop targets]
0121 = shrubs
0122 = ornamental or shade trees
0130 = ornamental bulb, corm rhizome plants (daylilies, iris, tulips, daffodils, etc.)
0131 = alstromeria (Peruvian lily, Lily-of-the-Incas)
0132 = carnations
0133 = chrysanthemums
0134 = orchids
0135 = poinsettias
0136 = roses
0139 = other ornamental plants
0200 = forest trees, forest lands
0201 = forest trees
0202 = forest lands
0203 = Christmas trees
0204 = combination of 0201 & 0202
0310 = veterinary/livestock
0311 = cattle
0312 = goats
0313 = swine (hogs, pigs)
0314 = sheep
0315 = poultry (chickens, ducks, geese, turkeys, ostrich, etc.)
0316 = dairy (cows, goats other mammals used for milk production)
0318 = other farm livestock not listed
0319 = combination of livestock
0320 = veterinary (pets)
0321 = dogs
0322 = cats
0323 = horses
0329 = other pests not listed
0330 = veterinary/wild animal
0331 = wildlife
0332 = laboratory research animals
0333 = zoo animals
1000 = Fruit Crops
1010 = Small fruits
1011 = blackberry, boysenberry, dewberry, loganberry, raspberry, youngberry,
1015 = blueberry
1016 = cranberry
1017 = currant
1018 = elderberry
1019 = gooseberry
1020 = grapes (for wine see beverage crops)
1021 = huckleberry,
1022 = strawberry
1023 = bushberries, serviceberry, mulberry
1100 = Tree fruits unspecified
1110 = Citrus fruits
1101 = grapefruit
1102 = lemon
1103 = lime
1104 = oranges
1105 = tangelo, tangerine, other citrus hybrids
1106 = citron, kumquat, pummelo

1120 = Tree Nuts
1121 = almond
1122 = chestnut
1123 = filbert (hazelnut)
1124 = hickory nut
1125 = pecan
1126 = pistachio
1127 = walnut
1129 = other tree nuts e.g. brazil nuts, cashew, macadamia nut (bushnut), butternut

1130 = Pome fruits
1131 = apple
1132 = crabapple
1133 = pear
1134 = quince
1135 = mayhaw (hawthorn)

1140 = Stone Fruits
1141 = apricot
1142 = cherry
1143 = nectarine
1144 = peach
1145 = plum
1146 = prune

1200 = Subtropical and miscellaneous fruits
[avocado, banana, coconut, date, fig, guava, mango, loquat, olive, papaya, pawpaw,
persimmon, pineapple, passion fruit, pomegranate, plantain, litchi nut, kiwifruit,
caprifig, acerola, gingko nut, maney, surinam cherry, soursop, sugar apple (custard apple),
breadfruit, prickly pear, carambola, cherimoya, longan, mamaladebox, granadilla,
sapota, star apple, Japanese plum, sapodilla]

2000 = Beverage Crops
2001 = chicory
2002 = cocoa
2003 = coffee
2004 = cola
2005 = hops
2006 = mints
2007 = tea
2008 = wine grapes

3000 = Flavoring and Spice Crops [angelica, anise, balm, basil, caraway, cassia, catnip, celery,
cinnamon, cloves, coriander, cumin, dill, elecampane, fennel, fenugreek, ginger, hops, horehound,
horseradish, juniper, lavender, licorice, marjoram/ oregano, mint/peppermint / spearmint, mustard,
nutmeg, pennyroyal, pepper(black/white/ chili/paprika type), rosemary, rue, safflower, sage,
savory, sesame, bay/sweet bay, tamarind, tansy, tarragon, thyme, turmeric, vanilla, wintergreen,
wormwood, allspice, poppy, chamomile, costmary, hyssop, marigold, nasturtium, woodruff,
valerian]

4000 = Vegetable Crops
4100 = Curcurbit Vegetables
4101 = melons
4102 = cucumber
4103 = squash (all)
4104 = okra
4105 = gherkin
4106 = chayote
4200 = Fruiting Vegetables
   4201 = eggplant
   4202 = pepino
   4203 = pepper
   4204 = pimento
   4205 = tomato
   4206 = tomatillo

4300 = Leafy vegetables
   4301 = artichoke
   4302 = broccoli
   4303 = brussel sprouts
   4304 = cabbage
   4305 = cauliflower
   4306 = celery
   4307 = collards
   4308 = kale
   4309 = lettuce (all varieties),
   4310 = miscellaneous leafy vegetables e.g., chicory corn salad, dandelion, endive
   (escarole), fennel, cress, kohlrabi, , mustard, parsley, rhubarb, spinach, turnip, watercress,
   prickly pear cactus pads, grape leaves, bamboo shoots, broccoli raab, mustard cabbage
   (pak choi), chervil, roquette (arugula), dock, peppergrass

4400 = Root and Tuber Vegetables
   4401 = beets (not sugar)
   4402 = carrot (including tops)
   4403 = garlic
   4404 = horseradish
   4405 = Jerusalem artichoke
   4406 = leek
   4407 = onion (including green, spring and scallions)
   4408 = parsnip
   4409 = potato
   4410 = radish (all types)
   4411 = rutabaga
   4412 = miscellaneous root and tuber crops e.g., celeriac, chive, taro, salsify, shallot,
   sweet potato, turnip, yam, lotus root, manioc (cassava), arrowroot, yautia, water chestnut,
   chufa (ground almond)

4500 = Seed and Pod Vegetables
   4501 = beans (fresh and dried all types)
   4502 = peas (fresh and dried all types)
   4503 = bean sprouts (all types)
   4504 = carob

4600 = Miscellaneous vegetables
   4601 = algae
   4602 = asparagus
   4603 = mushrooms
   4604 = seaweed

5000 = Grains, Grasses and Fiber Crops
5010 = Fiber crops
   5011 = cotton
   5012 = flax
   5013 = miscellaneous fiber crops e.g., hemp, kenaf, ramie, abaca, broomcorn

5100 = Grasses for Forage, Fodder Hay and Silage
   [when intended use is forage, fodder hay and silage: millet, sorghum, corn, oats wheat, barley, rye,
   sudan grass, pasture, Bermuda grass, bluegrass, timothy, rice, millet, canary grass, grasses for bird
   seed]
5200 = Legumes and Related Crops for Forage, Fodder Hay and Silage
    [when intended use is forage, fodder hay and silage: alfalfa, beans, clover, cotton, lespedeza,
    peanuts, peas (including vines), sugar beets (including tops), vetch, trefoil, sainfoin, soybeans,
    carrot tops, carob, rape, kudzu, lupine, buckwheat]
5300 = Cereal Grain Crops
    5301 = barley
    5302 = corn
    5303 = millet (proso, broomcorn)
    5304 = oats
    5305 = rice
    5306 = rye
    5307 = sorghum
    5308 = teosinte
    5309 = triticale
    5310 = wheat
    5311 = wild rice
5400 = Sugar Crops
    5401 = honeycomb
    5402 = sugar beet
    5403 = sugarcane
    5404 = sugar maple
    5405 = sorghum
5500 = Miscellaneous Field Crops
    5501 = tobacco
    5502 = other field crops e.g., popcorn, pyrethrum, sesame, pine nuts, grasses for seed and
    non-forage use
6000 = Oil Crops
    6001 = field corn
    6002 = cotton
    6003 = mint / peppermint / spearmint
    6004 = olive
    6005 = peanuts
    6006 = safflower
    6007 = soybeans
    6008 = sunflower
    6009 = miscellaneous oil crops e.g., avocado, castor bean, flax, sesame, tung, wormseed, coconut,
    rape, jojoba, palm
6010 = Application to seeds
6020 = Processed foods not otherwise specified
6500 = Crops that cross categories 0900-6000
8500 = Other
8501 = mixed crop and non-crop areas
8599 = other special target sites NOS
9998 = NA
9999 = unknown

Comment: This variable was added effective January 1, 2003. This variable will provide users with information
on patterns of illness associated with particular crops when the crop itself is not the application target.
This information will be useful for developing intervention strategies. The coding scheme for this
variable is adapted from EPA and USDA coding. Information coded in this field should be at the most
specific level available. Note that last character for this variable is optional. It allows the most specific
level of coding for crops if a state wishes to capture this level of information. It should be right padded
with 0 as a default. This variable applies mainly to agricultural exposure events. For non-agricultural
events the default should be 9998 = NA. This variable should be used when APPTARGT is coded as
070 or 998. States may also use it to record the crop that exposed individuals were working in for
events involving drift. In that case, other APPTARGT codes (100-650) may apply.
EXPOCOMM (CEXPCOMM)
Definition: Describes additional important aspects of exposure not covered in variables in this section.
Width: 125
Type: Character
Core: Yes
FAQ: Narrative, describe anything that would impact on interpreting coded information. Information regarding anything unusual about the exposure event should be indicated here. Note equipment failures, judgments regarding adequacy of personal protective equipment, training, and specifics about the exposure site that are relevant, etc. Clarify the information coded in TYPEOTH if necessary (e.g. if this variable is coded as 1=Yes, indicate the specific type of exposure). Provide other background information on type and route of exposure (e.g. if INGESTION was coded as yes, indicate whether a pesticide product, contaminated food or drinking water was ingested). A brief descriptor of the incident is useful e.g. “24 workers picking cabbages in field were drifted on during aerial application to adjacent tomato field owned by another grower” or “worker had not been fit tested, had a mustache, and respirator cartridges had not been changed for 2 weeks, though worker applied pesticides several hours each day”.
Comment: This narrative can be as short as needed, and does not need to be written in sentence form.

AGENT INFORMATION
Chemical agent information should be structured as a relational database. Refer to the SPIDER Technical Manual that includes the data dictionary and Table Relationships for further information and suggested structure. The most specific level of data is the EPA Registration number. If this is not known, and cannot be determined based upon the product name, enter the active ingredient(s) (Generic in SPIDER). If the active ingredient(s) is not known, either CHEMCLAS or FUNCLAS must be entered with a value other than “unknown” or “not applicable”.

The system should permit entry of active ingredient PC Codes, chemical class or functional class when a specific product name or EPA registration number is not available. There should be sufficient room in the system to record information on an infinite number of products per individual. If this is not feasible then the system may be designed to permit entry of a minimum of 4 products per exposure incident. (If this approach is used, the products thought most likely to be responsible for illness should be coded.)

REG_NR (REG_NR)
Definition: The EPA Registration Number for the product composed of the 11-digit product registration number (1-6 digit manufacturer and 1-5 digit product identification numbers) and the 6-digit distributor number.
Width: 17
Type: Character
Core: No, see comments
FAQ: Use leading zeroes to pad the front of each part of the manufacturer number, the product and the distributor identification number for consistent entry. Search the EPA product look-up in SPIDER, the EPA Pesticide Product Label System (PPLS) (http://iaspub.epa.gov/apex/pesticides/f?p=PPLS:1 ), or the National Pesticide Information Retrieval System (NPIRS) (http://state.ceris.purdue.edu/) to determine the EPA registration number unless the registration number is available from the case investigation. If you have the name of a manufacturer, the product name, and/or the active ingredient(s) these websites may help you distinguish between products with the same name. If you do not have sufficient information to determine the specific product, do not enter a product name and registration number. Starting January 2010 the EPA registration number and the distributor number are kept in separate variables in SPIDER, EPAREG_NR and DIST_NR.
If you enter a registration number and find that the listed product name in SPIDER or the EPA Website does not match the product name identified as part of the report investigation check to see if you have an alternate name for the product. If the active ingredients do not match information obtained during the investigation, do not enter the EPA Registration code. Instead, enter the PC Code for the active ingredient(s) the individual was exposed to in the variable ACTIVING and make a note of the product name and Registration number in the AGCOM field. **Provide the EPA Registration number and the two product names to the NIOSH and the EPA for resolution of conflicting data.**

Many state level registrations can be found at the NPIRS website [http://state.ceris.purdue.edu/](http://state.ceris.purdue.edu/). Registrations for Oregon and Washington can be found at the Pesticide Information Center On-Line (PICOL) website: [http://cru66.cahe.wsu.edu/LabelTolerance.html](http://cru66.cahe.wsu.edu/LabelTolerance.html). Other states not covered by these two systems may have registrations listed at the state’s Department of Agriculture website.

**EPAREG_NR (EPAREG_NR)**

Definition: The EPA Registration Number for the product composed of the 11-digit product registration number (1-6 digit manufacturer and 1-5 digit product identification numbers) only.

| Width | 11 |
| Type | Character |
| FAQ | No |
| Coding | Character |
| Comment | See comment for REG_NR. When the product registration number is available, this is the variable used in the NIOSH aggregated database. |

**DIST_NR (DIST_NR)**

Definition: The 6-digit distributor number assigned by the EPA

| Width | 6 |
| Type | Character |
| FAQ | No |
| Coding | Character |
| Comment | See comment for REG_NR. |

**PRODUCT (CPRODUCTNAME)**

Definition: Manufacturer's designated name for the product

| Width | 70 |
| Type | Character |
| FAQ | No |
| Coding | Narrative |
| Comment | Literal documentation of product name. This should be taken directly from the list of products embedded in SPIDER, or the list that is available on the NPIRS web site. If the specific name of the pesticide product is not known then do not enter a product name, only enter an active ingredient PC Code in the field ACTIVING. |

If there is more than one product with the same name, and you do not know the manufacturer or the product registration number, you need to determine whether all products with that name contain the same active ingredient(s) in the same concentration(s) (the percentage of an ingredient in the product may vary by plus or minus 5%). If all products contain the same ingredient(s), in the same concentration (within 5% variation), then enter the product name, which occurs first when listing products in SPIDER or a NPIRS report on the product name. If the product name is associated with multiple products and the active ingredients are not the same, and you do not have any other information regarding the chemical name or chemical class, enter the Product Name in the AGCOM narrative, not in this field. (SPIDER users will enter the product name in the ‘Other Sources’ table on the EVENT screen. The product variable should not be used to collect information about spray adjuvants or fertilizers. If states desire to collect this information they should develop a separate
variable. SPIDER users may record spray adjuvants and fertilizers under the 'Other Sources' table on the EVENT screen.)

**ACTIVING (PC_CODE, EPA CODE, Chemical ID)**
Definition: EPA designated code for the active ingredient.
Width: 6
Type: Character
Core: No
FAQ: Coding: Numerical coding that matches the EPA PC Coding
Comment: The use of an additional variable for alpha names for the active ingredients is optional. There are multiple synonyms associated with each PC code in the EPA data system. Changes to the EPA data system in 2003 required a change in how states selected an alpha name for consistency in the name shown associated with a particular EPA designated PC Code. The variable PREFNAME was added effective January 2006 to address this issue. Programmers should see the SPIDER Technical Manual for additional discussion of this issue. In 2016 a non-EPA code, 999998 was added to collect cases with unregistered products/devices.

**PREFNAME (CPREFNAME)**
Definition: The flag to designate the NIOSH-SENSOR-Pesticides preferred chemical name associated with a particular EPA designated PC Code.
Width: 1
Type: Character
Core: No
FAQ: Coding: This variable uses automatic default coding assigned by the programmer, in SPIDER an asterisk is used to designate the preferred name.
Comment: See comments for ACTIVING.

**ACTINGP (NPESTPCNT)**
Definition: The percentage by weight of the active ingredient(s) contained in the pesticide product.
Width: 8
Type: Numeric
Core: No
FAQ: Coding: Numeric weight percentage with four decimal places.
Comment: The system should allow for multiple active ingredients per product and the percentage should be linked to specific product. Refer to SPIDER for suggested table relationships. This should be an automatically coded field based upon the EPA Registration # using data from either SPIDER or the NPIRS web site. Data may be entered manually if the available information is the active ingredient, and percent active ingredient in the product. Used to evaluate exposure.

**CHEMCLAS (CCLASS)**
Definition: Chemical classification of active ingredient
Width: 2
Type: Character
Core: No
FAQ: Code: 01 = organochlorine compound
02 = organophosphorous compound
03 = N-methyl carbamates
04 = pyrethrin
05 = pyrethroid
06 = dipyridyl compound
07 = chlorophenoxy compound
08 = triazines
09 = thiocarbamates
10 = organo-metallic compound
11 = inorganic compounds
12 = coumarins
13 = indandiones
14 = convulsants
15 = microbial
16 = dithiocarbamates
94= genetically modified organism (GMO)
95 = unidentified cholinesterase inhibitor
96 = other
97 = multiple (PC Code indicates a code for a combination of active ingredients that cross chemical
classes)
99 = unknown

Comment: This variable is intended to be automatically coded based on the specific active ingredient. The
surveillance program would not be expected to determine chemical classification unless the EPA
registration number, complete product name, or active ingredient name is unavailable. This chemical
class coding scheme is adapted from the World Health Organization 1990-1991 Guidelines. Only a
limited number of chemical types are coded. It is recognized that this list is not complete and that some
chemicals may fall into more than one classification. The code 96 will be used very rarely, and only for
active ingredient PC Codes that are assigned that code in the EPA data system.

**PRODCLAS (CPRODCLASS)**
Definition: Chemical classification of the product
Width: 2
Type: Character
Core: Yes
FAQ:
Coding:  
01 = organochlorine compound
02 = organophosphorous compound
03 = N-methyl carbamates (AChE inhibitor)
04 = pyrethrin
05 = pyrethroid
06 = dipyridyl compound
07 = chlorophenoxy compound
08 = triazines
09 = thiocarbamates
10 = organo-metallic compound
11 = inorganic compounds
12 = coumarins
13= indandiones
14 = convulsants
15 = microbial
16 = dithiocarbamates
17 = AChE inhibitors (combination of 02 and 03 only)
18 = AChE inhibitors with pyrethrin and/or pyrethroid only
19 = AChE inhibitors with pyrethrin and/or pyrethroid + other
20 = AChE inhibitors with organochlorine compounds
21 = AChE inhibitors with compounds not otherwise listed
22 = pyrethrin plus pyrethroid only
23 = pyrethrin plus pyrethroid plus other compound not otherwise specified
24 = inorganic plus organometallic compounds only
25 = organochlorine plus inorganic compounds
26 = pyrethrin plus other compounds not otherwise specified.
27 = pyrethroid plus other compounds not otherwise specified
94= genetically modified organism (GMO)
95 = unidentified cholinesterase inhibitor
96 = Includes one or more active ingredients, none of which fall into product classes "01" through "16".
97 = Multiple (product contains multiple active ingredients which do not fit in any of the codes specified in codes 17-25)
99 = unknown

Comment: This variable is intended to be automatically coded based upon the active ingredients present in the product formulation. If the active ingredients represent a combination of more than one chemical class not described in codes 17-25 then the product should be coded as 'multiple'. The only exception is if the product contains only two active ingredients, and one of them is a synergist or solvent (for a list see Appendix B, Table B-1) and the product is an insecticide. In this case the product class should be based on the product class of the non-synergist active ingredient.

The surveillance program would not be expected to determine chemical classification unless the EPA registration number, complete product name, or active ingredient name is unavailable. Contact NIOSH if there are questions regarding chemical class coding. This chemical class coding scheme is adapted from the World Health Organization 1990-1991 Guidelines. Only a limited number of chemical types are coded. It is recognized that this list is not complete and that some chemicals may fall into more than one classification. The code "95" should only be used for the rare circumstance when exposure is reported, and clinical testing indicates cholinesterase inhibition, but there is no further information available to classify the chemical product to which the individual was exposed. Either CHEMCLAS or FUNCLAS must be entered with a value other than "unknown" or "not applicable".

**FUNCLAS (CPRODTYPE)**

**Definition:** Functional classification of pesticide product.

**Width:** 2

**Type:** Character

**Core:** Yes

**FAQ:**

**Coping:**

01 = Insecticide (excluding solely IGR and fumigants)
02 = Insect Growth Regulator (IGR)
03 = Herbicide/algicide
04 = Fungicide
05 = Fumigant
06 = Rodenticide
07 = Disinfectant/Broad Spectrum for Water Sanitation
08 = Insect Repellent
09 = Antifouling agent (marine paints)
10 = Insecticide and Herbicide (01 & 03)
11 = Insecticide and Fungicide (01 & 04)
12 = Insecticide and Herbicide and Fungicide (01 & 03 & 04)
13 = Insecticide and Other (01 & 96)
14 = Herbicide and Fungicide (03 & 04)
96 = Other (includes biological controls, plant growth regulators, antibiotics, etc.)
97 = Multiple (product is classified as multiple classes which do not fit in any of the codes specified in codes 10-14)
99 = unknown

**Comments:** These functional classes are provided as an additional way to categorize products and exposures. These classes are not necessarily mutually exclusive. If a product is registered for more than one class of functional use choose the one that the product was being used for. If the product was being misused, code the registered use of the product, not how the individual was misusing it. The current EPA coding
of products includes many more codes than the recommended coding in this dictionary. Either
**PRODCLAS** or **FUNCLAS** must be entered with a value other than "unknown" or "not applicable".

**FORM (CPRODFORM2)**
Definition: Indicates the physical formulation of the product.
Width: 2
Type: Character
Core: No
FAQ:
Coding: 01 = Dust/powder (not pressurized)
02 = Granular/Flake
03 = Pellet/Tablet/Cake/Briquette
04 = Wettable Powder/dust
05 = Impregnated material (ant/plant stakes, animal collars, water filters, solid agar)
06 = Other dry formulation (crystalline, water dispersible granules, pressurized dust)
07 = Microencapsulated
08 = Emulsifiable concentrate
09 = Soluble concentrate
10 = Flowable concentrate
11 = Pressurized liquid/spray/fogger - Include aerosol spray cans
12 = Ready-to-Use Liquid/Solution
13 = Other liquid FORMULATION
14 = Pressurized Gas/Fumigant
16 = Other
99 = Unknown
Comment: This variable will be useful for evaluating exposure and for tracking trends related to particular types of pesticide formulations. This coding scheme is a condensed system based upon several EPA coding systems. A crosswalk between this list and the EPA formulation coding system is included in Appendix F. A variable characterizing the physical formulation of the product using the EPA formulation coding system is also provided in SPIDER.

**TOXCODE (CTOXCODE)**
Definition: EPA Signal word.
Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 0 = No signal word
1 = Danger
2 = Warning
3 = Caution
4 = Caution
Comment: This coding should be autocoded from EPA Lookup Table. It should reflect the signal word assigned to the product within the EPA system.

**ATTRIBUT (CATTRIBAI)**
Definition: EPA designated code for the attributed active ingredient.
Width: 6
Type: Character
Core: No
FAQ:
Coding: Numerical coding that matches the EPA PC Coding
Comment: Active ingredient to which poisoning is attributed. This should be taken directly from the list of active ingredients embedded in SPIDER for the product(s) that the illness/injury was attributed to.

**AGCOM (CAGENT)**
Definition: Describes additional important information about the pesticides involved in the exposure that is not captured by the variables in this section.

Width: 125
Type: Character
Core: No
FAQ: Narrative, describe anything that would impact on interpreting coded information. Note anything unusual about the products, including concerns about proper product identification.
Comment: This narrative can be as short as needed, and does not need to be written in sentence form.

**EVENTNARR (MEVENT)**
Definition: Describes additional important aspects of exposure not covered in other variables.
Width: 431
Type: Character
Core: No
FAQ: Narrative, describe anything about the event that would impact on interpreting coded information.
Comment: This narrative can be as short as needed, and does not need to be written in sentence form. This field is longer than EXPOCOMM, and can be used to provide event information that won’t fit in EXPOCOMM.

**HEALTH EFFECT DESCRIPTORS**
**BIOLOGIC MONITORING**
The following variables capture a minimal level of information about biological monitoring and diagnostic tests for pesticide residue and metabolites. Some states may choose to record more detailed information in the state database, but more specific information is not needed for the aggregated national database.

**CHLNTEST (CTESTTYPE)**
Definition: Indicates which cholinesterase test(s) if any, were performed.
Width: 1
Type: Character
Core: Yes
FAQ: Code as "8" for all non-cholinesterase inhibitors. Must be completed if data is used to support case classification.

**CHLNRESL (CRESULT)**
Definition: Indicates the results of cholinesterase testing, and what standard was used for the "normal" comparison.
Width: 1
Type: Character
Core: Yes
FAQ: 1 = abnormal compared to lab*
2 = abnormal compared to baseline **
3 = within normal limits compared to lab
4 = normal compared to baseline
7 = bad specimen
8 = not applicable
9 = unknown

Comment: Must be completed if data is used to support case classification. If both RBC and plasma were performed and only one was abnormal, code only the test result that was abnormal. If both tests were abnormal but a baseline was available for one test, code the results for the test with a baseline. Codes "3" and "4" were added to accommodate those states wishing to track "normal" cholinesterase results using this variable. These are optional codes, not required as part of the core data. States that do not wish to use these alternate codes may use "8 not applicable" when results are within normal limits or when cholinesterase testing was not performed. States that wish to collect detailed results of laboratory tests are referred to the SPIDER Technical Manual for a model of recommended coding of this data.

* Abnormal compared to lab is defined as a cholinesterase level below laboratory normal range when no baseline test result is available for comparison.

** Abnormal compared to baseline is defined as:
1) 30% depression from baseline (pre-exposure or 60-90 days post exposure) RBC cholinesterase level, and/or;
2) 40% depression from baseline plasma cholinesterase level. (N.Y. definition of cholinesterase depression)

OTHRBIOL (COTHERTEST)
Definition: Describes whether other biologic monitoring for pesticides and metabolites was performed that is not captured in previous variables.
Width: 1
Type: Character
Core: No
FAQ: 
Coding: 1 = Yes
2 = No
9 = Unknown
Comment: This field will allow tracking of how frequently other forms of biologic monitoring are performed

MEDICAL DIAGNOSIS

MEDDIAG (CDIAGNOSIS)
Definition: Provides a description of the medical diagnosis by the attending health care provider.
Width: 60
Type: Character
Core: No
FAQ: 
Coding: Narrative
Comment: Brief literal of diagnosis of individual's illness from attending health care provider. Left blank if none or unknown. Treatment information was removed as this was universally rejected as too cumbersome and not useful.

PREEXCON (No Equivalent SPIDER Variable)
Definition: Indicates whether the exposed individual had any pre-existing conditions that could impact on their response to exposure.
Width: 1
Type: Character
Core: No
FAQ: 
Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = pre-existing condition was not present (interview or medical record indicates that this information was solicited but condition was found not to be present or condition is clearly not applicable.)
9 = unknown

Comment: If coded as "1," "2" or "3" then COND1 through COND5 should be reported using the same coding system as PREEXCON.

COND1 (CPREGNANT)  Pregnant
COND2 (CASTHMA)  Asthma
COND3 (CALLERGIES)  Allergies (Note the specific allergy under COND5 (Other) if coded as "1", "2" or "3" and the coder is unsure if the allergy would impact the individual's susceptibility to exposure.)
COND4 (CMCS)  Multiple chemical sensitivities (acquired chemical intolerance)
COND5 (COTHERPRE)  Definition: Other. Describes other condition that could impact on the individual susceptibility to exposure that is not described in existing codes; or provides an explanation of coding for COND3 Allergies.

Width: 20
Type: Character
Core: No
FAQ: Narrative
Coding: Narrative
Comment: Brief literal of other conditions including physical or mental disability and medical conditions. Indicate whether the individual, clinician or both reported condition (use the same code numbers as PREEXCON). Note the specific allergy here if COND3 is coded as "1", "2" or "3" and the coder is unsure if the allergy would impact the individual's susceptibility to exposure.

FATAL (COUTCOME)  Definition:  Describes whether the exposed individual died, and if so whether the death was suspected to be related to pesticide exposure.

Width: 1
Type: Character
Core: Yes
FAQ:  Coding:  1 = fatal, suspected related to pesticide exposure
2 = fatal, not suspected to be related to pesticide exposure
3 = fatal, no determination made regarding relationship between death and pesticide exposure
8 = not applicable (i.e. This was not a fatality.)
9 = unknown
Comment:  It is recognized that not all states will report this variable due to concerns about legal ramifications of making this determination.

SIGNS AND SYMPTOMS  The specific symptoms were adapted from the American Association of Poison Control Centers Toxic Exposure Surveillance System.

DERMATOL (LDERMSYMP)  Definition:  Indicates whether health effect involved irritation or sensitization of skin.

Width: 1
Type: Character
Core: Yes
FAQ: Coding:  1 = yes (sign or symptom reported as present by individual or clinician)
2 = no (not reported, or unknown)
Comment: If coded as "1" then DERM1 through DERM7 and DERM9 should be reported using the coding system described for DERM1 below. If DERMATOL is coded as "2=No" then skip the variables DERM1 through DERM99.

DERM1 (BULLAE)
Definition: Bullae
Width: 1
Type: Character
Core: Yes
FAQ: Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
9 = unknown
Comment: Code bullae (blisters) from pesticide exposure in this variable. Exclude thermal burns unless they are directly related to the pesticide (e.g. a burning pesticide container).

DERM2 (CSKINBURN)
Definition: Burns (second and third degree) This should include burns from chemical exposure only.

DERM3 (CSKINEDEMA)
Definition: Edema (Edema/Swelling) Edema may be associated with allergic responses, angioedema, hives, etc. Include edema of extremities and joints. Include periorbital edema or swollen eyes.

DERM4 (CREDNESS)
Definition: Erythema Redness of the skin. Include first degree burns (added in 2011), facial flushing, or hot sensation of the skin (not a burning sensation which is coded under DERM6).

DERM5 (CRASH)
Definition: Rash/Irritation. Include: contact dermatitis, irritant dermatitis, rash, open skin sores, blepharitis, eczema.
Width: 1
Type: Character
Core: Yes
FAQ: Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
9 = unknown
Comment: Irritation was moved from DERM6 to DERM5 in June 2009. All reports of skin irritation (i.e. irritated skin that is visible) should be coded DERM5, whether reported by clinician or patient. Pain or burning sensation should be coded DERM6.

DERM6 (CSKINPAIN)
Definition: Pain. Include: pain, sensation of burning skin not associated with a thermal burn.
Width: 1
Type: Character

38
Core: Yes
FAQ: 
Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
9 = unknown

Comment: Tingling, numbness sensation of the extremities, face or ears should be coded under Paresthesia NS19. Skin irritation was coded with pain until June 2009. All reports of skin irritation (i.e. irritated skin that is visible) should be coded DERM5, whether reported by clinician or patient.

DERM7 (CPRURITIS)
Definition: Pruritis. Itchy skin.

DERM8 (PATTERN)
Definition: Describes the pattern of distribution for lesions described in the other DERM variables.
Width: 1
Core: Yes
FAQ: 
Coding: 1= Corresponds well with physical pattern of exposure
2= Discrete patches of lesions that do not correspond with what is known about the pattern of exposure
3= Generalized distribution of lesions on the body
4 = Not present (statement in chart notes or interviews indicates that information on lesions was sought but found not present)
9= Unknown

Comment: If more than one type of skin lesion is present this variable should be used to code for the predominant one. If no lesions are present code as "4 = Not present".

DERM9 (CHIVES)
Definition: Hives

DERM99 (COTHERDER)
Definition: Describes other dermatologic signs or symptoms not described in existing codes
Type: Character
Width: 20
Core: No
FAQ: 
Coding: Narrative
Comment: Brief literal of other dermatologic signs or symptom(s)

EYE (LOCCSYMP)
Definition: Indicates whether health effect involved direct contact with and injury to eye
Width: 1
Type: Character
Core: Yes
FAQ: 
Coding: 1 = yes (sign or symptom reported as present by individual or clinician)
2 = no (not reported, or unknown)

Comment: If coded as "1" then EYE1 through EYE7 should be reported using the coding system described for EYE1 below. If EYE is coded as “2=No” then skip the variables EYE1 through EYE8.

EYE1 (MIOSIS)
Miosis (Contraction of the pupil (pinpoint pupils)).

EYE2 (CEYEBURN)
Definition: Burns (Any reaction described as a chemical burn to the eye.)

EYE3 (CABRASION)
Definition: Corneal abrasion

EYE4 (CTEARS)
Definition: Lacrimation (tearing of the eyes)

EYE5 (CEYEPAIN)
Definition: Pain/irritation/inflammation (include the sensation of burning eyes or itching eyes, injection, irritation, red eyes)

EYE6 (CMYDRIASIS)
Definition: Mydriasis (Extreme dilation of the pupil)

EYE7 (CCONJDX)
Definition: Diagnosis of conjunctivitis. This variable should only be used for a diagnosis of conjunctivitis, when no specific information on signs and symptoms are provided.

Comment: This variable was previously coded under EYE5. Use of EYE7 was initiated in 2003.
**RESPIRAT** (LRESP)
Definition: Indicates whether health effect involved upper or lower respiratory symptoms
Width: 1
Type: Character
Core: Yes
FAQ:
 Coding: 1 = yes (sign or symptom reported as present by individual or clinician)
         2 = no (not reported, or unknown)
Comment: If coded as "1" then **RESP1** through **RESP11** should be reported using the coding system described for **RESP1** below. If **RESPIRAT** is coded as "2=No" then skip the variables **RESP1** through **RESP99**.

**RESP1** (CCOUGH)
Definition: Cough
Width: 1
Type: Character
Core: Yes
FAQ:
 Coding: 1 = clinician reported
         2 = exposed individual reported
         3 = reported by both
         4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
         9 = unknown
Comment: Note that “asthma attack” was moved to **RESP11** in 2003.

**RESP2** (CCYANOSIS)
Definition: Cyanosis (Bluish discoloration of the skin and mucous membranes associated with an increased concentration of deoxygenated hemoglobin in the blood.)

**RESP3** (CRESPPAIN)
Definition: Upper respiratory pain/irritation Include: congestion, sinus pain, sore throat, runny nose, oral or nasal rash or blistering, persistent sneezing, burning tongue, laryngitis, post nasal drip, clogged ears, chest heaviness.

**RESP4** (CDYSPNEA)
Definition: Dyspnea/Shortness of breath. Include: difficulty breathing, unable to get breathe, gasping, bronchospasm.
Width: 1
Type: Character
Core: Yes
FAQ:
 Coding: 1 = clinician reported
         2 = exposed individual reported
         3 = reported by both
         4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
         9 = unknown
Comment: Note that “asthma attack” was moved to **RESP11** in 2003.

**RESP5** (CTACHYPNEA)
Definition: Hyperventilation/tachypnea. (Rapid shallow breathing – more than 20 breaths per minute for adults.)

**RESP6** (CRESPEDEMA)
Definition: Pulmonary Edema

**RESP7** (CDEPRESS)
Definition: Respiratory depression

**RESP8** (CPLEURPAIN)
Definition: Pleuritic chest pain/pain on deep breathing

**RESP9** (CWHEEZE)
Definition: Wheezing

**RESP10** (CLRESPPAIN)
Definition: Lower respiratory tract irritation. Include rales, rhonchi, chest discomfort, crackles, chest tightness.

**RESP11** (CASTHMADX)
Definition: Diagnosis of asthma attack, or exacerbation of asthma due to exposure.

**RESP99** (COTHERRES)
Definition: Describes other respiratory symptoms not described in existing codes (eg. epistaxis (nosebleed), pulmonary fibrosis, respiratory failure, reactive airway disease, chemical pneumonitis).

**GI** (LGASTRO)
Definition: Indicates whether health effect involved gastrointestinal symptoms

**GI1** (CGASTPAIN)
Definition: If coded as “1” then GI1 through GI7 should be reported using the coding system described for GI1 below. If GI is coded as "2=No" then skip the variables GI1 through GI8.
Definition: Abdominal pain/cramping
Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
9 = unknown

**G12 (CANOREXIA)**
Definition: Anorexia (Loss of appetite)

**G13 (CCONSTIP )**
Definition: Constipation

**G14 (CDIARRHEA )**
Definition: Diarrhea

**G15 (CNAUSEA) **
Definition: Nausea

**G16 (CVOMIT) **
Definition: Vomiting

**G17 (Cbloody )**
Definition: Melena/Hematemesis/bloody stools or vomit (GI bleeding)

**G18 (COTHERGAST) **
Definition: Describes other gastrointestinal symptoms not described in existing codes
Width: 20
Type: Character
Core: Yes
FAQ:
Coding: Narrative
Comment: Brief literal of other gastrointestinal signs and/or symptom(s), such as difficulty swallowing (dysphagia).

**RENALGU** (LRENAL)
Definition: Indicates whether health effect renal/genitourinary symptoms
Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = yes (sign or symptom reported as present by individual or clinician)
2 = no (not reported, or unknown)
Comment: If coded as “1” then GU1 through GU4 should be reported using the coding system described for GU1 below. If RENALGU is coded as “2=No” then skip the variables GU1 through GU8.

**GU1 (CPOLYURIA) **
Definition: Polyuria (Frequent passing of urine)
Standardized Variables for State Surveillance of Pesticide-Related Illness And Injury

GU2 (COLIGURIA)
Definition: Oliguria/anuria (Reduced or absent urine production)

GU3 (CHEMATURIA)
Definition: Hematuria (Passing blood in the urine)

GU4 (CPROTEIN)
Definition: Proteinuria (Protein in the urine)

GU8 (COTHERREN)
Definition: Describes other renal/genitourinary symptoms not described in existing codes

NERVSENS (LNEUROLOGI)
Definition: Indicates whether health effect includes nervous/sensory symptoms

NS1 (ATAXIA)
Definition: Ataxia (Irregular muscular coordination.)
9 = unknown

**NS2 (CRESTLESS)**
Definition: Hyperactivity/anxiety/irritability (Include nervousness, anxious affect)

**NS3 (CCOMA)**
Definition: Coma

**NS4 (CCONFUSED)**
Definition: Confusion (Include problems with thinking other than memory loss.)

**NS5 (CSEIZURE)**
Definition: Seizure(s)

**NS6 (CFASIC)**
Definition: Fasciculations (Localized contraction of muscles resulting from the discharge of fibers that are innervated by a single nerve filament. These contractions can be seen under the skin.)

**NS7 (CHEADACHE)**
Definition: Headache

**NS8 (CWEAKNESS)**
Definition: Muscle weakness

**NS9 (CGRIDITY)**
Definition: Muscle rigidity

**NS10 (CPARALYSIS)**
Definition: Paralysis

**NS11 (CPERIPHERY)**
Definition: Peripheral neuropathy

**NS12 (CSLURRED)**
Definition: Slurred speech

**NS13 (CSWEAT)**
Definition: Diaphoresis/Profuse sweating (diaphoresis, heavy sweating, cold sweat)

**NS14 (CBLURRED)**
Definition: Blurred vision
Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
9 = unknown
Comment: Code blurred vision from mechanical eye injury under **EYE8**.
**NS15** (CDIZZY)
Definition: Dizziness

**NS16** (CMUSCLE)
Definition: Muscle pain (muscle aches, neck pain, back pain)

**NS17** (CFAINT)
Definition: Fainting

**NS18** (CPTYALISM)
Definition: Salivation (Include drooling and increased salivation)

**NS19** (CPARESTHESIAS)
Definition: Paresthesias (Sensation of burning or prickling of skin/tingling/numbness apart from a specific injury or rash)

**NS20** (CALTEREDTASTE)
Definition: Altered taste (Include metallic taste or chemical taste.)

**NS21** (CMEMORY)
Definition: Memory loss

**NS99** (COTHERNEU)
Definition: Describes other nervous/sensory symptoms not described in existing codes

**CARDVASC** (LCARDIO)
Definition: Indicates whether health effect includes cardiovascular symptoms

**CV1** (CBRADY)
Definition: Bradycardia (fewer than 60 beats per minute for adults)
9 = unknown

**CV2 (CARREST)**
Definition: Cardiac arrest (Include myocardial infarction.)

**CV3 (CCONDUCT)**
Definition: Conduction disturbance (Include atrial arrhythmia, atrial fibrillation, sinus arrhythmia, or ventricular arrhythmia.)

**CV4 (CTACHY)**
Definition: Tachycardia (more than 100 beats per minute for adults)

**CV5 (CHYPO)**
Definition: Low arterial blood pressure (systolic number is lower than 90 and/or diastolic number is lower than 60)

**CV6 (CHYPER)**
Definition: High arterial blood pressure (systolic number is 140 or higher and/or diastolic number is 90 or higher)

**CV7 (CCHESTPAIN)**
Definition: Chest pain

**CV9 (CPALP)**
Definition: Palpitations

**CV10 (HRATE)**
Definition: Heart rate
Width: 3
Type: Numeric
Core: Yes
FAQ:
Coding: Reported heart rate.
Comment: Report actual beats per minute from medical record. This will be used, along with age, to calculate severity of tachycardia or bradycardia.

**CV8 (COTHERCAR)**
Definition: Describes other cardiovascular symptoms not described in existing codes
Width: 20
Type: Character
Core: Yes
FAQ:
Coding: Narrative
Comment: Brief literal of other cardiovascular symptom(s)

**MISCSYMP (LGENERAL)**
Definition: Indicates whether health effect includes signs, symptoms or test results not captured by the other health effects categories.
Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = yes (sign or symptom reported as present by individual or clinician) 2 = no (not reported, or unknown)
Comment: If coded as “1” then MISC1 through MISC6 should be reported using the coding system described for MISC1 below. If MISCSYMP is coded as “2=No” then skip the variables MISC1 through MISC8.
MISC1 (CFEVER)
Definition: Hyperthermia/fever
Width: 1
Type: Character
Core: Yes
FAQ:
Coding: 1 = clinician reported
2 = exposed individual reported
3 = reported by both
4 = sign or symptom was not present (statement in chart notes or interviews indicates that information on sign/symptom was sought but found not present). Code changed to optional in 7/2004, based on consensus discussion that significant negative findings should be noted in narrative and do not need to be coded.
9 = unknown

MISC2 (CACIDOSIS)
Definition: Acidosis

MISC3 (CALKALOSIS)
Definition: Alkalosis

MISC4 (CANIONGAP)
Definition: Anion gap increase

MISC5 (CFATIGUE)
Definition: Fatigue/Malaise (Include: tired, generalized weakness, groggy, sleepy, lethargic, malaise, generalized discomfort or sense of illness, not feeling right.)

MISC6 (CMALAISE)
Definition: Malaise This variable was discontinued effective August 2003 and combined with fatigue.

MISC8 (COTHERGEN)
Definition: Describes other symptoms that do not fit into coding categories provided
Width: 20
Type: Character
Core: No
FAQ:
Coding: Narrative
Comment: Brief literal of other signs and/or symptom(s)

TYPE CARE AND LOST TIME

TYPECARE (CFIRSTCARE)
Definition: Describes the initial medical care sought following the exposure event.
Width: 1
Type: Character
Core: No
FAQ:
Coding: 1 = physician office visit
2 = emergency room visit
3 = hospital admission
4 = advice from poison control center
5 = no medical care sought
6 = other

48
Standardized Variables for State Surveillance of Pesticide-Related Illness And Injury

Rev October 2015

7 = employee health center
9 = unknown

Comment: Walk-in, non-emergency room and clinic visits should be coded a "1 physician office visit". There was a suggestion to add additional codes to determine the specific type of clinic. This information is not useful at the aggregate level and not collected by all states. On-scene treatment by emergency response personnel should be coded as "6=other" if it was the only treatment received. If on-site treatment by emergency response personnel is followed by other care, code the additional care. An individual should be considered hospitalized if they are formally admitted to the inpatient service of a hospital. This variable was discontinued and replaced by the TREATMENT SITE variables in January 2012.

TREATMENT SITE
The following nine variables document the site(s) of all medical care received following the exposure event. Check all that apply. The intent of this variable is to identify all of the sites where the individual obtained medical care for pesticide poisoning. Walk-in, non-emergency room, urgent care and clinic visits should be coded as "1" under TxDOCTOR. There was a suggestion to add additional codes to determine the specific type of clinic. It was decided not to capture such detailed information as it is not considered useful at the aggregate level and not collected by all states. This variable replaces TYPECARE which was discontinued on January 1, 2012.

TxDOCTOR (LTxDOCTOR)
Definition: Indicates whether the individual was treated at a physician’s office or medical care clinic.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2= no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case went to a doctor’s office or clinic, code as "2". This variable must be coded as "2" if either TxNONE or TxUNK is coded as "1". Walk-in, non-emergency room, urgent care and clinic visits should be coded as "1=yes".

TxED (LTxED)
Definition: Indicates whether the individual was treated at an emergency department.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2= no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case went to an emergency department, code as "2". This variable must be coded as "2" if either TxNONE or TxUNK is coded as "1".

TxHOSP (LTxHOSP)
Definition: Indicates whether the individual was admitted to a hospital for inpatient care.
Width: 1
Type: Logical
Core: No
FAQ:
Coding: 1 = yes
2= no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case was hospitalized, code as "2". This variable must be coded as "2" if either TxNONE or TxUNK is coded as "1".
**TxPCC** (LTxPCC)
Definition: Indicates whether the individual or health care provider received advice from a poison control center.
Width: 1
Type: Logical
Core: No
FAQ: 
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case received advice from a poison control center, code as "2". This variable must be coded as "2" if either **TxNONE** or **TxUNK** is coded as "1".

**TxONSITE** (LTxONSITE)
Definition: Indicates whether the individual was treated on-site by an emergency responder (e.g. ambulance).
Width: 1
Type: Logical
Core: No
FAQ: 
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case was treated by emergency response personnel, code as "2". This variable must be coded as "2" if either **TxNONE** or **TxUNK** is coded as "1".

**TxEHC** (LTxEHC)
Definition: Indicates whether the individual was treated by employee health clinic.
Width: 1
Type: Logical
Core: No
FAQ: 
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case was treated at an employee health center, code as "2". This variable must be coded as "2" if either **TxNONE** or **TxUNK** is coded as "1".

**TxOTHER** (LTxOTHER)
Definition: Indicates whether the individual received medical care at a site or of a type not otherwise specified.
Width: 1
Type: Logical
Core: No
FAQ: 
Coding: 1 = yes
2 = no
Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case received medical care not otherwise specified, code as "2". This variable must be coded as "2" if either **TxNONE** or **TxUNK** is coded as "1".

**TxNONE** (LTxNONE)
Definition: Indicates whether the individual declined to seek medical care.
Width: 1
Type: Logical
Core: No
FAQ: 

---

*Standardized Variables for State Surveillance of Pesticide-Related Illness And Injury*  
*Rev October 2015*
**TxUNK** (LTxUNK)

Definition: Indicates that the type of medical care received by the individual is unknown.

<table>
<thead>
<tr>
<th>Width</th>
<th>Type</th>
<th>Core</th>
<th>FAQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Logical</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

Comment: The default should be set to "2" for this variable. If it is unclear or unknown whether the case did not receive medical care, code as "2". This variable must be coded as "2" if **TxUNK** is coded as "1".

**HOSPSTAY** (NHOSPSTAY)

Definition: Length of hospital stay, in days.

<table>
<thead>
<tr>
<th>Width</th>
<th>Type</th>
<th>Core</th>
<th>FAQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Numeric</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

Comment: Useful as an indicator of severity and cost. An individual should be considered hospitalized if they are formally admitted to the inpatient service of a hospital. The length of hospital stay should be calculated as the number of patient days accumulated at time of discharge by a patient. A stay of less than 1 day (patient admission and discharge on the same day) is counted as 1 day in the summation of total days of care. For patients admitted and discharged on different days, the number of days of care is computed by counting all days from (and including) the date of admission to (but not including) the date of discharge. (The definitions of hospitalization and days of hospitalization are taken with minor adaptations from Graves EJ. National Hospital Discharge Survey: Annual summary, 1993. National Center for Health Statistics. Vital Health Stat 13(121), 1995.)

**LOSTTIME** (CLOSTTIME)

Definition: Indicates whether the individual lost one or more days from regular activities.

<table>
<thead>
<tr>
<th>Width</th>
<th>Type</th>
<th>Core</th>
<th>FAQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Character</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

Comment: This variable may be used as an indicator of severity and cost. The term unemployed refers to individuals with non-occupational exposures; either unemployed or non-working individuals. If time lost is less than one day this should be coded as "2 = no lost time". Use of this code was discontinued in January 2009 when it was replaced with LOSTWORK and LOSTACT.

**LOSTWORK** (NDLOSTW)

Definition: Indicates the number of days the individual lost from work.

<table>
<thead>
<tr>
<th>Width</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Numeric</td>
</tr>
</tbody>
</table>
Core: Yes
FAQ:
Coding: Number of days lost from work (day = at least 8 hours)
997 = Any lost time greater than 996 days
998 = An unknown number of days were lost
999 = Unknown if any days were lost
Comments: If the person was unable to work due to an illness or injury directly related to the pesticide exposure, indicate the number of days lost. This would include days hospitalized. The person must have lost a full day (at least 8 hrs work) to count it as a day of lost time. Count days of work lost whether or not the pesticide exposure took place at work. This variable replaced the previous lost time variable in January 2009 as being a more useful indicator of severity and cost. Work-related cases prior to 2009 that were coded time lost = “Yes, 1 or More Days Lost” have been recoded as 998. Cases that were time lost = “No Time Lost” were recoded as 0 days lost. Time lost = “Unknown” cases were recoded as 999. Code 998 should be used sparingly; whenever possible estimate the number of days lost (e.g., a couple of months = 60). Code 997 should be used if the exposure led to a permanent total disability, or any other time more than 996 days were known to be lost. If a person lost time due to illness or injury as a result of an exposure, and then was fired or quit, code only the number of days lost to illness or injury. If the person died due to an exposure, code fatal = yes, severity = fatal, and days lost = 0. If less than a full 8-hour day was lost, code days lost = 0. LOSTACT (NDLOSTA)
Definition: Indicates the number of days the individual lost from regular activities.
Width: 3
Type: Numeric
Core: Yes
FAQ:
Coding: Number of days lost from regular activities (day = at least 8 hours)
997 = Any lost time greater than 996 days
998 = An unknown number of days were lost
999 = Unknown if any days were lost
Comments: If the person was significantly restricted from regular daily activities due to an illness or injury directly related to the pesticide exposure, indicate the number of days lost. Examples of loss of regular activities include hospitalization, unable to get out of bed, incapable of being able to take care of children and needing to arrange for childcare, and/or having someone else provide meals because of an inability to provide one’s own food. Also, if the case is employed, but was not scheduled to work, list days lost from normal activities here. However, do not duplicate a count of a worker that lost a day from work and also was significantly restricted from regular daily activities. That is, if days lost were counted in the LOSTWORK variable, do not count the same days again here. If LOSTWORK is coded as 997, then code days lost in LOSTACT as 0. This variable replaced the previous lost time variable in January 2009 as being a more useful indicator of severity and cost. Non-occupational cases prior to 2009 that were coded time lost = “Unemployed, Lost Normal Activities” have been recoded here as 998. Non-occupational cases that were coded time lost = “No Time Lost” were recoded as 0 days lost. Time lost = “Unknown” non-occupational cases were recoded as 999. Code 998 should be used sparingly; whenever possible estimate the number of days lost (e.g., a couple of months = 60). Code 997 should be used if the exposure led to a permanent total disability interfering with the ability to perform normal daily activities. If the person died due to an exposure, code fatal = yes, severity = fatal, and days lost = 0. If less than a full day of activities were lost, code days lost = 0. HEALTHCOM (CHEALTHNAR)
Definition: Describes additional important aspects of illness, medical history, severity captured with variables in this section.
Width: 125
Type: Character
Core: No
FAQ:
INVESTIGATION FINDINGS

ENFORCEMENT AGENCY FINDINGS
For the variables in this section it is recognized that the determination regarding whether a violation has occurred must be made by the regulatory agency with jurisdiction in the appropriate area.

VIOFIFRA (CVIOFIFRA)
Definition: Indicates whether a violation of FIFRA or state pesticide regulations (including the Worker Protection Standard) was found by the regulatory agency responsible for enforcement of FIFRA and/or state pesticide regulations.

Width: 1
Type: Character
Core: No
FAQ:
Coding:  
1 = Violation cited
2 = Investigated, no violation cited
3 = Pending
4 = Individual refused referral
5 = Referred, not investigated – Use if the case was referred, but the enforcement agency made a decision not to investigate the referral due to resource issues, timeliness or other thresholds that were not met. Code added 10/2005, prior to that this circumstances was coded as '9-unknown'.
8 = Not applicable, surveillance program staff made decision not to refer to an enforcement agency
9 = Unknown

Comment: Will allow tracking of cases where illness or injury occurs but no violation is found. This variable should be used effective January 1, 2000. It replaces the variables VIOLATION1 and VFIFRAWP. It is recognized that there are often significant lag times between the exposure incident and when this information becomes available from the enforcement agency. Information should be entered whenever it becomes available.

VOSHA (COSHA)
Definition: Indicates whether a violation of occupational health or safety standards was cited by the agency responsible for enforcement of OSHA regulations.

Width: 1
Type: Character
Core: No
FAQ:
Coding:  
1 = Violation cited
2 = Investigated, no violation cited
3 = Pending
4 = Affected individual refused referral to an appropriate enforcement agency
5 = Referred, not investigated
8 = Not applicable, surveillance program staff made decision not to refer to an enforcement agency
9 = Unknown

Comment: Will allow tracking of cases where illness or injury occurs but no violation is found. It is recognized that there are often significant lag times between the exposure incident and when this information becomes available from the enforcement agency. Information should be entered whenever it becomes available.

VOTHER (CVIOL)
Definition: Indicates whether other violations associated with pesticide use, storage, or transport were found by a regulatory agency
Width: 125
Type: Character
Core: No
FAQ:
Coding: Literal, narrative describing agency and type of violation found
Comment: This variable is intended to capture other violations not included in FIFRA or OSHA (e.g. Federal Food Drug and Cosmetic Act).

**VIOLCOM (CVIOLNAR)**
Definition: Describes additional important aspects of regulatory violations found not captured with variables in this section.
Width: 125
Type: Character
Core: No
FAQ:
Coding: Narrative, describe anything that would impact interpretation of the coded information.
Comment: This narrative can be as short as needed, and does not need to be written in sentence form. Include information on violations cited, whether violation is closely related to exposure situation.

**VIOLATION1 (CFIFRA)**
Definition: Indicates whether a violation of FIFRA (other than the Worker Protection Standard) was found by the regulatory agency responsible for enforcement of FIFRA.
Width: 1
Type: Character
Core: No
FAQ:
Coding: 1 = Violation cited
2 = No violation cited
3 = Pending
4 = Individual refused referral
8 = Not applicable, surveillance program staff made decision not to refer to an enforcement agency
9 = Unknown
Comment: NOTE: This variable is replaced by VIOFIFRA effective January 1, 2000, and therefore should be omitted for data collected after that date. Will allow tracking of cases where illness or injury occurs but no violation is found.

**VFIFRAWP (CEPA)**
Definition: Indicates whether a violation was found by the regulatory agency responsible for enforcement of FIFRA Worker Protection Standard
Width: 1
Type: Character
Core: No
FAQ:
Coding: 1 = Violation cited
2 = No violation cited
3 = Pending
4 = Individual refused referral
8 = Not applicable, surveillance program staff made decision not to refer to an enforcement agency
9 = Unknown
Comment: NOTE: This variable is replaced by VIOFIFRA effective January 1, 2000, and therefore should be omitted for data collected after that date. Will allow tracking of cases where illness or injury occurs but no violation is found. This should record any WPS violation found regardless of the relationship between the violation and the pesticide-related illness or injury.
STATE SURVEILLANCE SYSTEM INVESTIGATION FINDINGS

States raised concerns about implications for workers of developing a variable that indicates the label was not followed. Employers could potentially access this information with repercussions for the worker depending upon the confidentiality rules of the agency managing the surveillance data. It was still felt that this was valuable information to capture.

LABEL (CLABELUSE)
Definition: Indicates whether there is evidence indicating that the product label was not followed.
Width: 1
Type: Character
Core: No
FAQ: Coding: 1 = Yes (there is evidence the label was not followed)
2 = No (label appears to have been followed)
8 = Not applicable (suspected intentional exposure)
9 = Unknown
Comment: This will allow recording of information regarding the label, without specifying the source of the information.

CONTRIBUTING FACTOR NARRATIVE (PNARR)
Definition: This variable should be used to provide details of the contributing factors.
Width: 431
Type: Character
Core: Yes
FAQ: See Appendix D for examples.
Coding: Narrative, describe anything that would impact or assist interpretation of the coded information.
Comment: Describe in as much detail as possible the factors that contributed to the pesticide illness or injury. This code was added in January 2009.

CONTRIBUTING FACTORS (PCODE)
Definition: Describes factors contributing to the exposure.
Width: 2
Type: Character
Core: Yes
FAQ: (See Appendix D)
Coding: 01 = Notification/posting lacking or ineffective
02 = People were in the treated area during application
03 = Inadequate ventilation of treated area before re-entry
04 = Early re-entry
05 = Required eye protection not worn or required eye protection inadequate
06 = Required gloves not worn or required gloves inadequate
07 = Required respirator not worn or required respirator inadequate
08 = Other required PPE not worn or inadequate
09 = Spill/splash of liquid or dust (not involving application equipment failure)
10 = Application equipment failure
11 = Pesticide stored within reach of child or other improper storage
12 = Decontamination not adequate or timely
13 = Intentional harm
14 = Excessive application of pesticide
15 = Label violations NOS (NOS – Not otherwise specified, other regulatory issues)
16 = No label violation identified but person still exposed/ill
17 = Drift
18 = Applicator not properly trained or supervised
19 = Illegal pesticide used/illegal dumping of pesticide
20 = Mixing of incompatible products
97 = Other (consider new code)
98 = Not applicable
99 = Unknown (Default value/uncoded)

Comment: This variable and the related comment variable will allow tracking of information on factors that may contribute to exposure and may be useful for developing intervention strategies. Choose up to five contributing factor codes. NIOSH will query these codes to find exposures in certain categories. If you would want a case to be found in such a query, please code it. For example, if a spill caused some product to splash into the eyes of someone not wearing required eye protection, you might want NIOSH to find the case if they were looking for all cases caused by spills and also if they are looking for all cases where required eye protection was not worn or was inadequate. In that case, code both 05 and 09. See Appendix D for additional information and coding examples. This code was added in January 2009.

THE FOLLOWING VARIABLES (WPS1 – WPS4) SHOULD ONLY BE COMPLETED IF THE EXPOSED INDIVIDUAL IS A WORKER OR PESTICIDE HANDLER ON AN AGRICULTURAL ESTABLISHMENT (FARM, NURSERY OR FOREST) AS DEFINED BY THE EPA WORKER PROTECTION STANDARD (1990 census industry codes of 010, 020 and 031, and 2002 census industry codes of 0170 and 0190).

WPS1A (CWPS1A) [Question: Did this incident involve entering a treated field, area or greenhouse?]
Definition: Indicates whether the exposure incident being investigated involved entry into an area, field, or greenhouse that had been treated with pesticides.
Width: 1
Type: Character
Core: No
FAQ: Coding: 1 = Yes
2 = No
9 = Unknown or not asked
Comment: This will allow recording of information regarding aspects of the worker protection standard and training issues. Leave blank if individual is not a farmworker (1990 census industry codes of 010, 020 and 031, and 2002 census industry codes of 0170 and 0190).

WPS1B (CWPS1B) [Question: Did the employer or the crew leaders tell you about how soon you could go into the area (field or greenhouse) after it was treated with pesticides?]
Definition: Indicates whether the current employer or crew leaders had told the individual about how soon they could go into the area after it was treated with pesticides.
Width: 1
Type: Character
Core: No
FAQ: Coding: 1 = Yes
2 = No
8 = Not applicable
9 = Unknown or not asked
Comment: This will allow recording of information regarding aspects of the worker protection standard and training issues. Leave blank if individual is not a farmworker (1990 census industry codes of 010, 020 and 031, and 2002 census industry codes of 0170 and 0190). Code as not applicable if WPS1A is coded as “2= No”.

WPS2 (CWPS2) [Question: This season with your current employer, has your employer/crew leader(s) told you about illnesses or injuries that could be due to pesticides?]
Definition: Indicates whether the current employer or crew leaders had told the individual during this season about illnesses or injuries that could be due to pesticides.

Width: 1
Type: Character
Core: No
FAQ: 
Coding: 1 = Yes
2 = No
9 = Unknown or not asked

Comment: This will allow recording of information regarding aspects of the worker protection standard and training issues. Leave blank for all non-farmworkers. NOTE: This variable was discontinued as of January 1, 2005.

**WPS3 (CWPS3)**

*Question:* This season with your current employer, has your employer/crew leader(s) ever told you about where to go or who to contact for emergency medical care for an illness or injury that happens at work?

Definition: Indicates whether the current employer or crew leaders had told the individual this season about where to go or who to contact for emergency medical care for an illness or injury at work.

Width: 1
Type: Character
Core: No
FAQ: 
Coding: 1 = Yes
2 = No
9 = Unknown or not asked

Comment: This will allow recording of information regarding aspects of the worker protection standard and training issues. Leave blank for all non-farmworkers. NOTE: This variable was discontinued as of January 1, 2005.

**WPS4 (CWPS4)**

*Question:* In the past 12 months has someone taught you about the safe use of pesticides and the use of personal protective equipment?

Definition: Indicates whether the individual indicated that they had been taught about the safe use of pesticides and the use of PPE in the last 12 months.

Width: 1
Type: Character
Core: No
FAQ: 
Coding: 1 = Yes
2 = No
9 = Unknown or not asked

Comment: This will allow recording of information regarding aspects of the worker protection standard and training issues. If they received training on only one of the two components (pesticide safety or use of PPE) code as no. Leave blank for all non-farmworkers NOTE: This variable was discontinued as of January 1, 2005.

**CASE CLASSIFICATION**

**C_EXPOSE (CDOCEXP)**

Definition: Describes the level of how laboratory, clinical or environmental evidence that corroborates exposure

Width: 2
Type: Character
Core: Yes
FAQ: A.1., A.2., A.3., A.4., A.5., A.6., A.13., and A.14 (See Appendix C)
Coding: 1a = Analytical results from foliage residue, clothing residue, air, soil, water or biologic samples document exposure
1b = Observation of residue and/or contamination (including damage to plant material from herbicides) by a trained professional

[Note: a trained professional may be a plant pathologist, agricultural inspector, agricultural extension agent, industrial hygienist or any other licensed or academically trained specialist with expertise in plant pathology and/or environmental effects of pesticides. A licensed pesticide applicator not directly involved with the application may also be considered a trained professional.]

1c = Biologic evidence of exposure (e.g. response to administration of an antidote such as 2-PAM, Vitamin K₄, or repeated doses of atropine)

1d = Documentation by a licensed health care provider of a characteristic eye injury or dermatologic effects at the site of direct exposure to a pesticide product known to produce such effects (these findings must be sufficient to satisfy criteria B.1 under documentation of adverse health effects)

1e = Clinical description by a licensed health care provider of two or more post-exposure health effects (at least one of which is a sign) characteristic of the class of pesticides as provided in Appendix 2 of the Case Definition for Acute Pesticide-Related Illness and Injury Cases. (See http://www.cdc.gov/niosh/topics/pesticides/)

2a = Evidence of exposure based solely upon written or verbal report by report by case

2b = Evidence of exposure based solely upon written or verbal report by report by witness

2c = Evidence of exposure based solely upon written or verbal report by written records of application

2d = Observation of residue and/or contamination (including damage to plant material from herbicides) by other than a trained professional

2e = Other evidence suggesting that an exposure occurred

3 = Strong evidence that no pesticide exposure occurred

4 = Insufficient data

Comment: Codes “3” and “4” should be back padded with blanks to fill the two character width.

C_EFFECT (CDOCHEALTH)
Definition: Level of documentation of post-exposure health effect
Width: 1
Type: Character
Core: Yes
FAQ: A.9, A.10 A.11. A.12. (See Appendix C)
Coding: 1 = Two or more new post-exposure abnormal signs and/or test/laboratory findings reported by a licensed health care provider
2a = Two or more new post-exposure abnormal symptoms were reported. When new post-exposure signs and test/laboratory findings are insufficient to satisfy a score of 1, they can be used in lieu of symptoms toward satisfying a score of 2 for Health Effects (C_EFFECT).
2b = Any new illness or exacerbation of pre-existing illness diagnosed by a licensed physician, but information on signs, symptoms and/or test findings are not available or insufficient for a 1 or 2a score.
3 = No new post-exposure abnormal signs, symptoms, or test/laboratory findings were reported
4 = Insufficient data (includes having only one new post-exposure abnormal sign, symptom, or test/laboratory finding).

C_CAUSAL (CDOCACUSE)
Definition: Level of evidence indicating a causal relationship between exposure and illness.
Width: 2
Type: Character
Core: Yes
FAQ: A.9., A.10., A.11., A.12. A.16 (See Appendix C)
Coding: 1a = Where the signs and symptoms documented under the Health Effects criteria (C_EFFECT) are characteristic for the class of pesticide as provided in Appendix 2 of the Case Definition for Acute Pesticide-Related Illness and Injury Cases, and the temporal relationship between exposure and health effects is plausible (the pesticide class refers to the one classified under criteria C_EXPOSE). (See http://www.cdc.gov/niosh/topics/pesticides/)
1b = Where the signs and symptoms documented under the Health Effects criteria (C_EFFECT) are consistent with an exposure-health effect relationship based upon the known toxicology (i.e. exposure
dose, symptoms and temporal relationship) of the putative agent (i.e. the agent classified under criteria C_EXPOSE) from commonly available toxicology texts, government publications, information supplied by the manufacturer, or two or more case series or positive epidemiologic studies published in the peer-reviewed literature.

2 = Evidence of exposure-health effect relationship is not present. This may be because the exposure dose was insufficient to produce the observed health effects. Alternatively, a temporal relationship does not exist (i.e. health effects preceded the exposure, or occurred too long after exposure). Finally, it may be because the constellation of health effects are not consistent based upon the known toxicology of the putative agent from information in commonly available toxicology texts, government publications, information supplied by the manufacturer, or the peer-reviewed literature.

3 = Definite evidence of non-pesticide causal agent

4 = Insufficient toxicologic information is available to determine causal relationship between exposure and health effects. (This includes circumstances where minimal human health effects data is available, or where there are less than two published case series or positive epidemiologic studies linking health effects to exposure to the particular pesticide product or class of pesticides.)

Comment: Codes “2” - “4” should be back padded with blanks to fill the two-character width.

STATUS (CSTATUS)
Definition: Final case classification, using NIOSH classification matrix.
Width: 1
Type: Character
Core: Yes
FAQ: Coding: 1 = Definite
2 = Probable
3 = Possible
4 = Suspicious
5 = Unlikely
6 = Insufficient information
7 = Asymptomatic
8 = Unrelated

Comment: This coding can be set up as an automatic code using the matrix, and should not be overridden. If the state feels the matrix classification is not correct, then the state final classification should be recorded in USERSTAT, and a narrative explaining the reason for the classification difference must be included in USERREAS. States may choose to add additional codes for their own use to indicate whether asymptomatic individuals had documented exposures, but that level of information is not collected for aggregation of data.

USERSTAT (CUSERSTATUS)
Definition: Final case classification, using state classification matrix, or overriding the NIOSH classification matrix with a written explanation.
Width: 1
Type: Character
Core: No
FAQ: Coding: 1 = Definite
2 = Probable
3 = Possible
4 = Suspicious
5 = Unlikely
6 = Insufficient information
7 = Asymptomatic
8 = Unrelated
9 = Unknown/uncoded
Comment: A narrative explaining the reason for the classification difference between STATUS and USERSTAT must be included in USERREAS.

USERREAS (CUSERREASO)
Definition: Explanation of why the final case classification indicated by STATUS and USERSTAT are different.
Width: 125
Type: Character
Core: See comments
FAQ: Coding: Narrative
Comment: This variable must be completed if USERSTAT is not 9 = Unknown/uncoded. This narrative can be as short as needed, and does not need to be written in sentence form.

SEVERITY (CSEVERITY)
Definition: Final coding of the severity of the case using the standardized criteria of the severity index which can be found at http://www.cdc.gov/niosh/topics/pesticides/. A brief description of each of the six severity categories follows.
Width: 1
Type: Character
Core: Yes
FAQ: B.11
Coding: 1 = Death This category describes a human fatality resulting from exposure to one or more pesticides. 2 = High severity illness or injury
The illness or injury is severe enough to be considered life threatening and typically requires treatment. This level of effect commonly involves hospitalization to prevent death. Signs and symptoms include, but are not limited to, coma, cardiac arrest, renal failure and/or respiratory depression. The individual sustains substantial loss of time (> 5 days) from regular work (this can include assignment to limited/light work duties) or normal activities (if not employed). This level of severity might include the need for continued health care following the exposure event, prolonged time off of work, and limitations or modification of work or normal activities. The individual may sustain permanent functional impairment.
3 = Moderate severity illness or injury
This category includes cases of less severe illness or injury often involving systemic manifestations. Generally, treatment was provided. The individual is able to return to normal functioning without any residual disability. Usually, less time is lost from work or normal activities (≥3-5 days), compared to those with severe illness or injury. No residual impairment is present (although effects may be persistent).
4 = Low severity illness or injury
This is the category of lowest severity. It is often manifested by skin, eye or upper respiratory irritation. It may also include fever, headache, fatigue or dizziness. Typically, the illness or injury resolves without treatment. There is minimal lost time (<3 days) from work or normal activities.
8 = Evaluated, not applicable
This category indicates that the case data was classified as 'Unlikely', 'Insufficient information', 'Asymptomatic' or 'Unrelated' and the severity index is not applied.
9 = Unknown, not yet evaluated
This indicates that an assessment for the severity index has not been done. It is the default value for a new record.
Comment: Refer to the Severity Index for a full description of the purpose of this variable and the method of coding. Note that we recognize that the severity index cannot address all conceivable clinical situations. Therefore, it is not realistic to insist on strict adherence to these. The user must be flexible when using this severity index, given that the user will not infrequently need to employ judgment and experience when assigning severity. If severity is assigned that does not adhere to the index a short narrative explanation should be included in the variable HEALTHCOM. This narrative can be as short as needed, and does not need to be written in sentence form.
APPENDICES

Appendix A  Operational Guidelines for Determination of Injury at Work

Appendix B  Table of active ingredients considered as solvents and synergist, excluded from consideration when determining insecticide product chemical class (PRODCLAS)

Appendix C  Frequently Asked Questions (FAQs) - Case Definition and Standard Variables for Surveillance of Pesticide-Related Illness and Injury

Appendix D  Contributing factors coding instructions

Appendix E  Variables found in the NIOSH multi-state database but not present in the standardized variable document

Appendix F  Formulation coding crosswalk
APPENDIX A: Operational Guidelines for Determination of Injury at Work

1. Complete the injury at work item if any other than natural cause of death is mentioned in Part I or Part II of the medical certification, including homicides, suicides, and accidents, including motor vehicle deaths.

2. The injury at work item must be completed for decedents ages 14 or over and may be completed for those less than 14 years of age if warranted. Consider possibility of work injury regardless of whether injury occurred in the course of work in "usual" or other occupation and/or industry. If decedent's "usual" occupation is housewife, student or retired consider injury during other employment. If occupation is transportation-related, suspect injury at work and evaluate per criteria.

3. Consider available information with regard to location and activity at time of injury. If location is farm, suspect work-related and evaluate per criteria.

APPENDIX C: Frequently Asked Questions (FAQs) - Case Definition and Standard Variables for Surveillance of Pesticide-Related Illness and Injury

A. Case Definition

1. The terms signs and symptoms are used throughout the case definition. What is the difference between the two?

**Answer:** **Signs** are objective findings that are observed and described by a licensed health care professional. Typically, this is the information one would find in the "physical exam" or "physical findings" section of a medical record, or acute poisoning reporting form. These findings do not rely on the subjective reporting of sensations by the affected individual. An objective knowledgeable observer includes all licensed health care professionals (e.g. MD, DO, PA, RN, EMT etc.).

**Symptoms** are any subjective evidence of a disease or a condition as perceived and reported by the patient. This includes reported changes from normal function, sensation, or appearance. You would find this information in the "History" section of a medical record.

2. How should we classify the exposure when an affected individual, their coworker or family member indicates that they were "drenched" by pesticide spray?

**Answer:** If there is no other corroborating evidence presented by an objective observer then the information meets criteria "A2". If there is documentation by medical personnel, emergency responders (police, Emergency Medical Technician, etc.), an employer, agency representative, or investigators that the individual was observed to be drenched at the scene or treatment facility this would be classified as meeting criteria "A1b". However, it must be remembered that these observers must be **objective and independent**, and therefore they can not be the affected individual.

3. How should an exposure be classified when an individual has a dermal exposure that is difficult to document as a direct exposure?
For example: A person handles an object contaminated with pesticides then touches another part of the body with their possibly contaminated hand. The individual then develops a dermal response at the site of hand contact.

**Answer:** If the individual is confident that contact with the pesticide product definitely occurred, and the hand to body part contact occurred shortly afterward, and the dermal response is documented by a licensed health care professional, code the exposure as "A1d" (documentation by a licensed health care professional of a characteristic eye injury or dermatologic effects at the site of direct exposure to a pesticide product known to produce such effects). Code as "A2" (evidence of exposure based solely upon written or verbal report) if the dermal response is not documented by a licensed health care professional. If the history is vague, or contact may have been with a plant or product other than a pesticide, code as "A4" (insufficient data).

4. How do we interpret cholinesterase results when performing case classification?

**Answer:** Each state may choose to develop their own internal guidelines. The following very cursory discussion is provided to assist states in this process. Cholinesterase depression is defined as one (or more) of the following:

1) 30% depression from baseline (pre-exposure or 60-90 days post exposure) RBC cholinesterase level
2) 40% depression from baseline plasma cholinesterase level
3) Cholinesterase level below laboratory normal range.

The level of depression may be determined by serial post-exposure testing if a baseline test is not available. (For example - testing 2 weeks and 4 weeks post exposure show a gradual increase in cholinesterase by percentages in 1 and 2 above, over the levels at initial testing.) A test that shows significant depression as described above should be considered evidence of exposure, and ranked as meeting criteria "A1c". It should also be considered evidence for a new post-exposure health effect and helps to meet the criteria for "B1" (an additional post-exposure sign or test/laboratory finding would be needed to fully meet the criteria for "B1"). A test result which does not indicate...
depression should not be considered an indication that substantial exposure has not occurred. The timing of testing, laboratory variation, the wide normal range, and administration of praloxidime chloride (2PAM) prior to testing can all lead to negative results.

5. Can the applicator who is directly affected by exposure, or has performed the application that is associated with health effects supply information that can be considered "evaluation by a trained professional" specified in criteria "A1b"?

**Answer:** No. Individuals who are considered professional observers should be objective. An applicator who is the 'case' cannot be considered an objective observer. Nor can an applicator be an objective observer when there are allegations or observations suggesting a misapplication may have occurred. A trained, licensed applicator not directly involved with the case could be an observer under "A1b". For example, a second applicator is called in to help evaluate damage to plants on the property, or to help alleviate odors in an office from an application by another applicator. This second individual's observation can meet the requirements of a trained professional observer as specified in "A1b".

6. What is the definition of antidote that should be used to evaluate exposure (A1c)?

**Answer:** By antidote, we mean an agent that counteracts the effects of the pesticide. There are two types of antidotes that satisfy this definition: pharmacological antidotes and specific antidotes. Pharmacological antidotes counteract the pharmacological effects of the absorbed pesticide. Often, individuals poisoned with pesticides have a high tolerance to repeated doses of pharmacological antidotes. For example, those poisoned with anticholinesterase pesticides have a high tolerance to atropine. As such, very high doses of atropine are often required to treat individuals poisoned with anticholinesterase pesticides. Another pharmacological antidote is phenobarbital.

Specific antidotes interact directly with absorbed pesticide or some product of it to block the biochemical effect of the pesticide. Examples include pralidoxime chloride (2-PAM), vitamin K, and pesticide-specific monoclonal antibodies that are under development.

Antidotes are not the same as adjunct treatment that may help relieve symptoms or effects of the exposure in a less direct manner. This also does not include agents that prevent absorption of the ingested pesticide (e.g. activated charcoal).

7. How can we end up with a classification that is different from the clinical diagnosis in the medical record? Isn’t that "second guessing" the physician’s evaluation of the patient?

**Answer:** The case classification scheme and the clinical diagnosis serve different purposes. The purpose of the case classification scheme is to serve surveillance and epidemiologic-related functions. The classification scheme provides objective guidelines for assessing the certainty of the evidence regarding exposure and health effects. In contrast, the purpose of the clinical diagnosis is to guide the immediate treatment course for the individual. In addition, the clinician may use more intuitive and subjective criteria when making a diagnosis. Therefore, it is possible that the classification category may differ from the clinical diagnosis.

8. The classification scheme seems too stringent. By excluding individuals who report only one symptom, we may be missing important cases. For example, a child with seizures after DEET exposure would be excluded. How can we address this?

**Answer:** The classification scheme does require the presence of at least two post-exposure symptoms for a report to be considered a case. This may result in the exclusion of a very small number of actual pesticide-related illnesses or injuries. Most concerns about excluding cases due to this criterion can be alleviated by using structured protocols for obtaining medical histories from the individual and/or health care professional. If a single sign or symptom is reported, requesting more details will usually elicit additional signs or symptoms. Asking about commonly related symptoms as part of an interview is an acceptable practice. For example, it is appropriate to ask about symptoms of nausea if an individual reports vomiting; stomach cramping if diarrhea is reported, or loss of consciousness with seizure. This approach should help resolve concerns about the classification system resulting in false negatives.
9. How do we assess signs and symptoms when an individual has a pre-existing condition that may influence their physiologic response to an exposure?

Answer: Few studies have examined the effect of pre-existing disease on the toxicity of pesticides. We are not aware of any studies that found differences in signs and symptoms among pesticide-poisoned individuals with pre-existing conditions. Therefore, if someone presents with an atypical set of symptoms for a particular pesticide, a score of C2 should be strongly considered under "evidence supporting a causal relationship between pesticide exposure and health effects".

However, it is possible that those with some pre-existing conditions will have reduced physiologic reserve. Therefore, these individuals may manifest symptoms at a lower pesticide dose compared to a young, healthy individual. Nonetheless, in these individuals, the signs and symptoms should be characteristic of the particular pesticide, and the temporal relationship should be appropriate.

It is possible that pesticide exposure may exacerbate a pre-existing condition (e.g., organophosphate exposure can cause increased shortness of breath in exposed individuals, including individuals with chronic lung disease). However, the signs and symptoms that are present should be consistent with poisoning from the pesticide in question.

10. How do we address a situation when the underlying condition may create a set of symptoms that are similar to the symptoms caused by the pesticide?

Answer: As has been stated previously, pesticide exposure may exacerbate a pre-existing condition. However, keep in mind that the signs and symptoms that are present should be consistent with poisoning from the pesticide in question. In addition, there should be an appropriate temporal relationship (i.e. exposure preceded the health effect and the latency between exposure and effect is appropriate), and the pesticide exposure should be of sufficient dose.

11. How do we determine whether the evidence for an exposure-health effect relationship is insufficient versus inconsistent?

Answer: When there is little literature on the health effects associated with a particular pesticide and none of it describes the health effects of interest, then the evidence for an exposure-health effect relationship is considered "insufficient" and a score of "C4" is appropriate. However, if there are many references on the health effects associated with a particular pesticide, and none describe the health effects of interest, then the evidence for an exposure-health effect relationship is considered "inconsistent" and a score of "C2" is appropriate.

12. The term "exposure dose" is used in section C (Evidence supporting a causal relationship between pesticide exposure and health effects). Often little information is available on dose. How should we interpret "dose"?

Answer: The use of this term refers to whether the dose was sufficient to produce the observed health effects. Unfortunately, there is a paucity of data available on the minimum dose of a pesticide needed to produce health effects in humans. In addition, reaction to a pesticide exposure can vary across individuals. It should be remembered that some individuals may be much more sensitive to a pesticide and manifest health effects at a much lower dose compared to other individuals. Other factors such as duration of exposure, use of protective equipment, amount of time between exposure and collection of the environmental sample, and the effect of intervening weather conditions on environmental samples and observations must be factored in when evaluating the actual "exposure dose" likely experienced by the individual. When available, the peer-reviewed literature should be examined for guidance. The judgment of colleagues in the State Department of Agriculture may also be helpful.

When dealing with self-reports, qualitative information on exposure dose can be obtained. For example, information can be obtained about proximity to the source of exposure, duration of exposure, did health effects manifest in others who were exposed, etc. Assessing this information may require experience and the assistance of other knowledgeable colleagues.
13. Often we learn that an individual was exposed to a particular functional class of pesticides (e.g. insecticide, herbicide, etc.), but we can’t determine the name of the product or the active ingredient. Should an exposure score of "A2=written or verbal report" or "A4=insufficient data" be assigned?

**Answer:** When only the pesticide functional class is known, a score of “A4=insufficient data” must be assigned with two exceptions. This is because the pesticides within a particular class can vary widely in toxicity. Therefore, it would be impossible to determine if any observed health effects are consistent and or characteristic with the pesticide exposure. However, if the chemical class of the pesticide is known (e.g. organophosphate, or carbamate), but the specific pesticide product or active ingredient is unknown, a score of "A1" or "A2" can be considered. This is because pesticides within a specific chemical class can produce similar health effects (see Appendix 2). The two exceptions for the rule on functional class involve disinfectants and rodenticides. If the exposure was to a disinfectant or rodenticide, then a score of A2 can be used because the health effects from the active ingredients included in these pesticide functional classes are usually very similar.

14. Can documentation or a clinical description "by a licensed health care professional" as specified in criteria "A1d", "A1e" and "B1", be provided by the licensed health care professional who is directly affected by exposure (please note that this is similar to question Q5)?

**Answer** No. Individuals who are considered professional observers should be objective. A health care professional who is the 'case' cannot be considered an objective observer. A licensed health care professional not directly involved in the exposure event would meet the criteria under "A1d", "A1e" and "B1".

15. How should one handle an individual who was exposed to a product whose active ingredient is an organophosphate, but which is also 97-98% fertilizer, and they develop a skin rash after exposure? Should this exposure be included as a case with exposure-health effect as consistent with the known toxicology of the product or excluded because it is probably the fertilizer that caused the reaction, not the pesticide in the product?

**Answer** Since the fertilizer components are part of the pesticide formulation the exposure should be included in determining whether the rash is related to the product exposure. Do not list the organophosphate as the causative ingredient. Indicate the product as a causative agent and add a note to the health comments that the illness was thought to be caused by components of the formulation other than the organophosphate active ingredient. (This same approach should be used for cases where a solvent or carrier component of the product is the likely causative agent.)

16. We are seeing more cases with new and different health effects than those already established in the toxicological literature associated with the pesticide. These health effects are fairly consistent among the cases yet the coding structure for Causal Relationship doesn’t allow for closer analysis of these cases. These cases are classified as “Unlikely” since part C. Evidence Supporting Causal Relationship between Pesticide Exposure and Health Effects is to be coded “2” Evidence of exposure-health effect is not present. Why isn’t C. 4- insufficient toxicological information (resulting in Suspicious) an option?

**Answer** C.4- insufficient toxicological information needs to be reserved only for those pesticides that have little to no toxicological information for the same reason presented for wanting to set apart the cases described above. Including both types of cases would complicate analysis. To avoid modifying the standardized variables and not lose these cases whose classification may someday change to reflect changes in the existing toxicological literature, states may code these C-2 Unlikely and User-code: “4” Suspicious, with the explanation “health effects not consistent with existing toxicology.”

**B. Standard Variables**

1. How should a case be entered and tracked by a surveillance program if an individual has a pesticide exposure in one state, receives initial medical care in that state, then is discharged to follow-up care in a different state? (For example: a long haul trucker exposed while transporting chemicals in one state, who then receives follow-up care in the state where s/he lives.)
**Answer:** The case should be entered into the data system of any surveillance program that receives a report. States have different guidelines on confidentiality and case follow-up when cooperating with another state’s health agency. These guidelines must be followed. The state where the exposure occurred can usually best address issues related to the exposure and prevention, and often has better access to reporter records (e.g. PCC, health care professional) and regulatory agency reports. However, health care professionals located in a state other than where the exposure occurred may be reluctant to cooperate with an investigation by a state other than the one where they practice. There may be duplication of cases in the national aggregated dataset if the case is reported to the surveillance program in the state where exposure occurred and is unaware that the case was also reported to the program in the case’s state of residence. This should not be a major concern since it is a rare event. To minimize the duplication of cases arising under this scenario, relevant states should attempt to determine which state will take “ownership” of the case.

2. How should the variable “application target” be coded if the product is misapplied (e.g., man uses a fogger in a car). Is the application target the car interior (intended target of applicator), or building surface (intended target according to the product label)?

**Answer:** The application target is used to code the intended target of the applicator not the targets specified on the product label. For the situation described, you can code the car as the target. This would not be included under building surface category, since it is not really a building or room, and falls outside of the label description. Since a specific code for “vehicle” does not exist for this variable, this application target would be coded as "850=other".

3. A carpentry crew was exposed to herbicides while repairing railings adjacent to a flowerbed. The herbicide was applied before the carpentry crew began their work but it was never incorporated into the soil. The carpentry crew worked for approximately 1 week in and around the treated flowerbed. They experienced health effects related to the exposure. Which of the Exposure Type variables should be coded as yes; CONTACT or SURFACE?

**Answer:** Code the variable SURFACE as “Yes”. It appears that these workers were exposed to a treated surface (i.e. flowerbed). In contrast, code CONTACT as “No”. "Contact" exposures have more of an accidental/emergency quality involving direct contact with the concentrated or diluted pesticide product (i.e. cleaning up pesticide spills; a pesticide applicator using a leaking container; falling into a puddle of pesticide, etc). Note: The variable CONTACT was discontinued effective January 1, 2006.

4. How should LOSTWORK and LOSTACT be coded for an agricultural worker who was ill in bed all weekend following a work-related exposure.

**Answer:** If this individual routinely would not have worked on the weekend then LOSTWORK should be coded as "0 days lost" and LOSTACT as “2 days lost”. If the person usually worked on the weekend but was unable to work due to exposure-related illness, then LOSTWORK should be coded as "1 (or 2) days lost" and LOSTACT should be “1 (or 0) days lost” depending on whether they would normally have worked one or both weekend days.

5. How should activity at time of exposure (ACTEXPIND) be coded for situations where an individual was exposed to an insecticide that they or someone else applied to their skin?

**Answer:** If the individual applied the pesticide to themselves or another individual the activity should be coded as 11 = applying pesticide to human skin, hair or clothing. The application target (APPTARGT) should be coded with a code in the range of 700-703.

6. How should activity at time of exposure (ACTEXPIND) be coded for situations where an individual was exposed to a pesticide that they had previously applied hours before, but were not in the act of applying at the time they were exposed? One example is when a person sets off a total release fogger and leaves the premises for four hours, but when ventilating the house upon return, becomes ill. Another example is when an individual applies a product with a strong smell and doesn’t leave the premises, and after smelling it for several hours begins to feel ill.

**Answer:** ACTEXPIND should be coded as 09 (routine indoor activity) since the application itself was not what caused the case to be exposed.
7. If a mix/loader was preparing to spray an apple orchard and spilled pesticide during the mixing/loading operation, and therefore never actually sprayed the orchard should the APPTARGT be coded 113=Pome Fruits or 998=Application not involved?

**Answer:** In this situation since the individual was in the preparation process for spraying and the apples were not treated, code APPTARGT as 998. Since the intended target was apples, CROP should be 1130 = pome fruits or 1131 = apple. This coding will allow the state to track problems associated with mixing, loading and applications associated with this particular crop. If the intended target is unknown, code APPTARGT as ‘unknown’. In a situation where individuals are exposed from drift, the target should be coded in APPTARGT and the crop that the exposed workers were working in should be coded in CROP.

8. If there is a spill of pesticides while the product is in transit, e.g. a lawncare truck on a highway involved in a vehicular accident with the contents spilling, how should APPTARGT be coded?

**Answer:** In this scenario, APPTARGT should be coded as “998=N/A - application not involved” since there was no application, nor were the lawncare workers engaged in activities (e.g. loading and mixing) to prepare for an imminent application. CROP should be coded as 0100 = landscape.

9. The standard variable coding indicates that the variable APPLICTR should be coded ‘4 Unlicensed, adult not under supervision of licensed applicator during application’ if the setting is a private home and the homeowner is using an over-the-counter (OTC) pesticides. Why isn’t this coded N/A since the homeowner wouldn’t need to be licensed? Likewise we are directed to code a child handling an OTC pesticide and exposing himself or others in his own home as 5 Unlicensed child (16 years old or younger) not under supervision of licensed applicator during application rather than N/A.

**Answer** We'd prefer to code these situations as 4 and 5 respectively, as we instruct in the standardized variable document. This is because if we have several illness cases associated with an OTC pesticide, APPLICTR data may suggest the need for the pesticide to be restricted to licensed applicators. If APPLICTR is coded as NA (8) in these cases, we'll need to dig through the narrative comments to figure out who performed the application and whether they were licensed. That type of effort may be too time-consuming to undertake, and may lead to a failure to recognize that the pesticide should be restricted.

10. How should 'incidental exposures' be coded for the variable PPE?

**Answer** Incidental exposures are exposures that would not be expected when the individual is conducting their regular activity. This includes circumstances when an individual might know that pesticides were used, but they would not usually wear any PPE. Thus, agricultural workers contacting plant material after a reentry interval has expired would expect to work without PPE and not have a problem. Other common incidental exposures include: - office workers or home owners exposed to residue from structural or surface treatment after any reentry period - individuals in a retail establishment where a spill has occurred, if they are not involved in the actual clean-up - individuals handling pets that have been flea dipped by a pet groomer

In these situations, PPE should be coded as 2 = no, PPE was not worn if it is known that PPE was not worn. Otherwise PPE should be coded 9 = unknown.

11. We investigated a case that reported symptoms of wheezing and shortness of breath to poison control. The case did not see a physician. Because these signs/symptoms are categorized as moderate in the severity chart, the case severity was moderate. Why was this case’s severity changed to low by NIOSH?

**Answer** Severity does depend on the signs and symptoms’ severity category, however, as shown in the severity flow diagram, the overall severity code depends also on whether health care was sought and the length of hospital stay and/or number of days lost from work or normal activities if not employed. In the case above, the individual did not seek healthcare and did not miss any work or regular activities. Following the flow chart, this results in a low severity overall. The description of each severity category is a summary only and is not meant as a coding tool. When coding severity, both the flowchart and the sign/symptom tables must be consulted.
# APPENDIX D: Contributing factors coding instructions

<table>
<thead>
<tr>
<th>Codes</th>
<th>Code description</th>
<th>Instructions for coding and comment field</th>
<th>Examples of text for comment field</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Notification/posting lacking or ineffective</td>
<td>Use comment field to indicate if posting or notification was required. Note if it was WPS/state/local/label requirement. Describe any posting or notification that did occur, and how it failed to meet requirements. Note if there was a citation issued.</td>
<td>“Workers not told field had been sprayed, saw no signs.” “Resident set off foggers without telling roommates.” “Landscape application not posted as required by state law. Citation given.”</td>
</tr>
<tr>
<td>02</td>
<td>People were in the treated area during application</td>
<td>If known, use comment field to state why people were present. Indicate whether or not the applicator knew others were present.</td>
<td>“Worker sprayed in the office without clearing the area; unaware that spraying could cause health problems.” “Applicator unaware that irrigation worker was in orchard during ground spraying due to lack of communication on the farm.” “Employee accompanied pesticide applicator to unlock doors.”</td>
</tr>
<tr>
<td>03</td>
<td>Inadequate ventilation of treated area before re-entry</td>
<td>Code if you suspect that ventilation of treated area was a problem. Specify in the comment field if label requirements for ventilating building/greenhouse were not followed.</td>
<td>“Homeowner waited specified time before returning, but did not open windows to ventilate.” “Shipping container had strong smell when opened.” “Person reported strong odor in office upon re-entry.”</td>
</tr>
<tr>
<td>04</td>
<td>Early re-entry</td>
<td>If known, include the REI or the re-entry statement on label. Indicate how early people entered the area. This applies to WPS/state/local/label requirements. This code also applies to home products.</td>
<td>“REI was 4 hrs, workers report that they followed the spray rig along the row.” “Homeowner ran back in house to cover fish tank after activating foggers.” “Label states ‘keep unprotected persons out of area until sprays are dry’ but vegetation still wet when worker began pulling out the sprayed plants.”</td>
</tr>
<tr>
<td>05</td>
<td>Required eye protection not worn or required eye protection inadequate</td>
<td>State the required eye protection (safety glasses, goggles, face shield). Did they wear it? In the comments, include the following information if known: 1) the employer did not provide the equipment; 2) the employee removed it (and why); 3) the wrong type was worn; or 4) the eye protection was not fitted properly.</td>
<td>“Goggles fogging up, took them off.” “Employer didn’t provide; employee unaware they were required.” “Label requires goggles, applicator wore safety glasses” “Wearing sunglasses, thought this counted as eye PPE.” “Goggles not tight fitting, seal breaks when he turns head at end of row.”</td>

| 11   | Within reach of child or other improper storage | Indicate if stored within reach of children, transferred to or stored in an inappropriate container such as a food or beverage container, or if left out after use. When this code is selected, use discretion when coding any other codes. Label violations (4-8, 15) and intent to harm (13) usually do not apply to children, unless the child was mature enough to understand the requirements and implications of pesticide use. | “Lice shampoo left out on counter. Toddler drank it.”  
“Cat knocked insecticide off garage shelf.”  
“6 y/o sprayed brother in face in retail store aisle. He got the can off a low shelf”  
“Someone brought in Pine Sol in a pop bottle. He thought it was his pop and took a swallow.”  
“Brought insecticide into work to share; transferred to plastic containers that melted.” |
| 12   | Decontamination not adequate or timely       | Code if decontamination of person, equipment, or spill did not occur, or was not done in a timely manner. When known, explain why. Indicate if decontamination supplies were not available or inadequate. Include inability to change clothes and/or wash after spill/splash. | “Spilled pesticide on skin, kept working. No decontamination supplies on the truck.”  
“Worker did not have eye wash handy; washed out eye with iced tea drink.”  
“Spill not cleaned up for three days, strong odor in indoor air.”  
“Worker spilled pesticide on skin. He washed up & put on clean cloth coveralls, but did not change out of contaminated jeans.” |
| 13   | Intentional harm                              | Cases involving intentional harm to self, others, pets or wildlife. These could be referred to law enforcement. If person is attempting to use it for intended purpose but just doesn’t follow label, code the specific label violation or use code 15 for other label violations. | “Spouse suspected of intentional harm with mothball application.”  
“Baited hotdogs with OP to poison neighbor’s annoying dog.”  
“Ate rat poison in suicide attempt.” |
| 14   | Excessive application                         | Indicate if a pesticide was applied above the label rate or if an excessive number of products were used. | “Product applied at too high a rate.”  
“Swam in over-chlorinated pool.”  
“Sprayed house not realizing housemate had already sprayed earlier.”  
“Inspector noticed visual signs of over-application.”  
“Spraying in windy conditions.”  
“Didn’t read label, used outdoor insecticide indoors”  
“Disinfectant used to kill ants. Not labeled use.” |
| 15   | Label violations NOS (NOS – Not otherwise specified, other regulatory issues) | Code other label violations, not listed under another code. This includes spraying when windy, and failure to clean up or an off-label application (site or pest). | “Wore all required PPE, still exposed during application.”  
“Entered field 6 hrs after REI expired and became ill.”  
“Allergic reaction despite all PPE worn, person may have been sensitive.”  
“Label states ‘wear eye protection’, but a splash reached around sides of safety glasses.”  
“Eye PPE not required, but eye exposure resulted in severe reaction.”  
“No label requirement for clearing area or ventilating before reoccupying.” |

</table>
| 17   | Drift       | “Patient felt spray on arm 80 ft from the application.”
|      |             | “Warm weather caused product to volatilize and move into adjacent building.”
|      |             | “School bus driver alleged that air blast sprayer did not turn off nozzles at end of row, spray hit bus windshield. No samples to confirm or cite for drift.” |
| 18   | Applicator not properly trained or supervised | “Unlicensed person applying Restricted Use Pesticide without direct supervision.”
|      |             | “Employer didn’t provide PPE or safety instruction.”
|      |             | “Not his usual job, unaware of the chemical hazards.”
|      |             | “Not supervised appropriately”
|      |             | “Patient unable to read label in English, no one read or explained to him.” |
| 19   | Illegal pesticide used/Illegal dumping | “Methyl parathion applied illegally to homes.”
|      |             | “Tres Pasitos, an illegal pesticide, was used in the home.”
|      |             | “Illegal dumping of pesticide containers.” |
| 20   | Mixing incompatible products | “Mixed bleach and acid cleaner in mop bucket.”
|      |             | “Washed walls with ammonia and then floor with bleach.” |
| 97   | Other (consider new code) | “Pesticide fire created hazardous fumes. Building evacuated.” |
| 98   | Not applicable | Not applicable |
| 99   | Unknown (Default value/Uncoded) | “No interview with patient; unsure how exposed”
|      |             | “Spray records not provided; don’t know if REI observed.” |
APPENDIX E: Variables found in the NIOSH multi-state database but not present in the standardized variable document
(Updated May 22, 2013)

1. **Indcat** This is the industry category variable NIOSH generally uses in their analyses. It collapses industries coded for all cases into sectors.

   ```
   if indcic = '010' or indcic = '011' or indcic = '030' then indcat = 1;
   if indcic ge '060' and indcic lt '400' then indcat = 2;
   if indcic ge '400' and indcic lt '500' then indcat = 3;
   if indcic ge '500' and indcic lt '700' then indcat = 4;
   if indcic ge '700' and indcic lt '900' or indcic = '012' or indcic = '020'
   then indcat = 5;
   if indcic ge '900' and indcic lt '933' then indcat = 6;
   if indcic = '999' or indcic = '000' or indcic = '990'  then indcat = 9;
   ```

2. **Ag** This code is used to identify cases in the agriculture industry.

   ```
   Ag=0;
   If indcat=1 then ag =1;
   ```

3. **Occcat** This is the occupational category variable NIOSH generally uses in their analyses. It collapses occupational codes seven categories

   ```
   format occcode occfmt. ;
   if occcode lt 3 then occcat=9;
   if occcode ge 3 and occcode lt 203 then occcat = 1;
   if occcode ge 203 and occcode lt 403 then occcat = 2;
   if occcode ge 403 and occcode lt 473 then occcat = 3;
   if occcode ge 473 and occcode lt 503 then occcat = 4;
   if occcode ge 503 and occcode lt 703 then occcat = 5;
   if occcode ge 703 and occcode lt 903 then occcat = 6;
   if occcode ge 903 and occcode lt 905 then occcat = 7;
   if occcode = 999 then occcat = 9;
   format occcat occcatfmt. ;
   ```

4. **Prod_type_new** = functional class. This is the functional class variable NIOSH uses in their analyses. It collapses functional classes from all products the case was exposed to. The SAS code for this is available upon request.

5. **Prod_class_new** = chemical class. This is the chemical class variable NIOSH uses in their analyses. It collapses chemical classes from all AIs the case was exposed to. The SAS code for this is available upon request.

6. **ppe_cat** This collapses information into PPE used 1=yes, 2=no, 3=unknown.

   ```
   if ppe in ('1' '2' '3') then ppe_cat=1;
   ```
if ppe in ('4' '5' '6') then ppe_cat=2;
if ppe in ('8' '9' ' ') then ppe_cat = 3;

7. **Severitynew = severity**

The severity variable was not finalized until 2001. NIOSH uses the following code if severity is missing (used for pre-2001 SENSOR-Pesticides data, in SPIDER to calculate severity, and when adding severity to CDPR data)

/*low*/
severitynew=4;

/*moderate*/
if severitynew1=4 and (hospstay gt 1 and hospstay lt 998) then severitynew1=3;
/* Revised from if (hospstay ge 1 and hospstay le 3) then severitynew1=3; */
if cv1 in (1 3) then severitynew1=3;
if cv3 in (1 3) then severitynew1=3;
if cv4 in (1 3) then severitynew1=3;

if index(upcase(resp99),'RESPIRATORY FAILURE')> 0 then
severitynewl=2; /*added*/
if index(upcase(resp99),'WET LUNG')> 0 then severitynewl=2; /*added*/
/*fatal*/
if fatal in (1 2 3) then severitynewl=1;
run;

8. Yearexpo = Year of exposure. This is pulled from the DATEEXPO.

9. Yearrept = Year of report. This is pulled from the DATEREPT.

10. typeexp_new = The type of exposure variable was revised in 2006. NIOSH uses the following code
to combine pre- and post-2006 data and to collapse the type of exposure variables into one variable.

if drift='1' and spray='0' and indoorair='0' and surface='0' and contact='0'
and typeoth='0' and targeted='0' and leakspill='0' and typeunk='0' then
typeexp_new='1';
if drift='0' and (spray='1' or targeted='1') and indoorair='0' and surface='0' and contact='0' and typeoth='0' and leakspill='0' and typeunk='0' then typeexp_new=' 2';
    if drift='0' and spray='0' and indoorair='1' and surface='0' and contact='0' and typeoth='0' and targeted='0' and leakspill='0' and typeunk='0' then typeexp_new=' 3';
    if drift='0' and spray='0' and indoorair='0' and surface='1' and contact='0' and typeoth='0' and targeted='0' and leakspill='0' and typeunk='0' then typeexp_new=' 4';
    if drift='0' and spray='0' and indoorair='0' and surface='0' and contact='1' or leakspill='1' and typeoth='0' and targeted='0' and leakspill='0' and typeunk='0' then typeexp_new=' 5';
    if drift='0' and spray='0' and indoorair='0' and surface='0' and contact='0' and typeoth='1' and targeted='0' and leakspill='0' and typeunk='0' then typeexp_new=' 6';
    count=0;
    if drift='1' then count+1;
    if spray='1' or targeted='1' then count+1;
    if indoorair='1' then count+1;
    if contact='1' or leakspill='1' then count+1;
    if typeoth='1' then count+1;
    if typeunk='1' then count+1;
    if count gt 1 then typeexp_new = ' 7';
    if drift='0' and spray='0' and indoorair='0' and surface='0' and contact='0' and typeoth='0' and targeted in ('0' ' ') and leakspill in ('0' ' ') and typeunk='1' then typeexp_new=' 9';
    if drift='0' and spray='0' and indoorair='0' and surface='0' and contact='0' and typeoth='0' and targeted='0' and leakspill='0' and typeunk='0' then typeexp_new='99';
run;

11. Ppeany_new = a single variable to determine if any PPE was used.

if pptype1="1" then ppeany_new=1;
