Naloxone: Talking About Naloxone with Patients Prescribed Opioids

This guide offers tips to help providers communicate the benefits of naloxone to patients, family members, and caregivers.

Step 1: Start a conversation about naloxone.

Make it clear that you care about your patient's safety, and when possible, involve family and friends in the conversation. For example, “One of the risks with opioid medications is they could cause your breathing to slow or stop. Because you are taking an [opioid OR central nervous system depressant] OR [opioid] at a high dose, there is a risk that this could happen to you even accidentally. Would you mind if I talk to you about naloxone, a medicine when given by your [spouse, caretaker, etc.]?”

Next explain how to identify the signs of an opioid overdose, when and how to use naloxone, and where patients and families can get naloxone.

Step 2: Describe naloxone as a medication to be used to save a life.¹

Naloxone saves lives because it can quickly restore normal breathing to a person whose breathing has slowed or stopped as a result of overdosing on opioid medications, heroin, or other drugs (e.g., cocaine, methamphetamine) that are mixed or laced with the opioid fentanyl.

Pre-conversation Tip:

Before having a conversation about naloxone, make sure to familiarize yourself with the various forms and brand names of naloxone and administration route. Open the conversation with what naloxone is and does. Three forms of naloxone products are available, nasal spray, injection, and auto-injection. Refer to the Substance Abuse and Mental Health Administration’s (SAMHSA) Opioid Overdose Prevention Toolkit to educate patients, caregivers, and the community about the different forms and how to use them.

“Naloxone is a lifesaver, like having a fire extinguisher. Hopefully, you will not need it, but it is important to have it ready just in case you do—for yourself or for someone else.”²

Step 3: Listen attentively and respond to concerns and questions.³

Ask open-ended questions to demonstrate your desire to gain insights from your patient and their families.³ Doing so allows the patient to answer with more detail compared to questions requiring a yes or no response. Guide your patient, do not direct them. Conversations that are patient-centered and collaborative, can help increase a patient’s motivation to change.

When starting conversations about naloxone with patients new to prescription opioids and patients with an opioid use disorder (OUD), avoid stigmatizing language that may negatively impact patient care.⁴

The following are terms to use and avoid when talking to patients about prescription opioids and and to patients with an OUD.

<table>
<thead>
<tr>
<th>WORDS TO USE⁴</th>
<th>WORDS TO AVOID</th>
</tr>
</thead>
</table>
| Opioid overdose epidemic
Drug or drug overdose crisis | Opioid epidemic
Drug epidemic |
| Prescription opioids
Prescription opioid pain medications | Painkillers |
| Substance use disorder or opioid use disorder | Drug habit
Substance abuse |
| Person in recovery
Person with a substance use/opioid use disorder
People who use drugs | Former user/former addict
Abuser/user
Addicts
Junkies
Perpetrators
Criminals |
| Nonmedical use | Recreational use |
| Positive or negative toxicology screen | Clean/dirty toxicology results |
| Medication for opioid use disorder, medication-assisted treatment or medication-assisted recovery | Opioid replacement/substitution |

If your patient is interested in learning more about the benefits and risks of prescription opioids you can refer them to the Prescribed Opioids conversation starters.
