Other Resources Related to Sodium Reduction for STLTS

Legislative Actions to Commend, Support, or Gather Information on Sodium Reduction: Summary of Related Laws and Policies

Legislatures can commend, support, or gather sodium reduction information by publishing legislative findings, supporting various programs and projects, educating the public, and studying the health issue. The state laws and policies found in legislative history and policy archives, while not exhaustive, present opportunities that legislatures have taken to ensure that sodium is a factor in the health decisions the public makes. Other laws have brought attention to the issues of high blood pressure, cardiovascular disease, and general nutrition promotion, but the scope of this research only includes those laws that have expressly address sodium. Examples of these provisions are listed in the following Appendix, Table of Laws and Policies Related to Legislative Actions to Commend, Support, or Gather Information on Sodium.

Three states commended or supported various activities surrounding dietary sodium:

- California’s legislature passed a resolution in 2008 urging the US Food and Drug Administration (FDA) to respond to the public consumption of sodium by reclassifying it as an additive in food. That resolution also urged the US Department of Agriculture and the US Department of Health and Human Services to set new guidelines addressing the amount of sodium in foods.
- North Carolina’s legislature supported measures aimed at decreasing heart disease and stroke and encouraged its citizens to reduce dietary sodium in a 2011 resolution.
- Finally, a South Dakota law authorized the state Board of Education to adopt a policy recommending standards for food and beverages to local agencies, including that schools offer fruits and vegetables without added sodium and remove salt shakers from all cafeteria tables.

A Louisiana law authorized regulations to gather information on sodium, particularly requiring foods sold in schools to be analyzed for sodium content, and requiring availability of sodium information from manufacturers of certain foods in schools in order to conduct nutrient analyses of menus, compare nutritional contents of like or similar products, and serve as an incentive for food companies to improve the nutritional content of their products. Louisiana’s legislature also directed its Department of Social Services to assess efforts to promote healthy food choices among recipients of the federal Supplemental Nutrition Assistance Program (SNAP), acknowledging that foods purchased may be high in sodium.

State legislatures in Colorado, Illinois, and New Jersey acknowledged sodium’s role in healthy diets and lifestyles in findings related to other nutrition laws. In an effort to educate the public, Pennsylvania’s legislature adopted a resolution recognizing May 2009 as National High Blood pressure Education Month, listing salt and sodium as risk factors for that condition.
