OVERVIEW

This document describes the 2019 and 2020 National Hospital Care Survey (NHCS) Enhanced Opioid Identification Dataset that was created by the Enhanced Opioid Identification Algorithm. The algorithm was created using funding awarded to the National Center for Health Statistics from the Assistant Secretary for Planning and Evaluation (ASPE) Office of the Secretary – Patient Centered Outcomes Research Trust Fund (OS-PCORTF).

This document provides:

- description of the algorithm methodology and case definitions.
- information about the records available in the dataset.
- resources for additional information.

ENHANCED OPIOID IDENTIFICATION ALGORITHM

Data Source

Enhanced Opioid Identification Algorithm was developed using the National Hospital Care Survey (NHCS). The **NHCS** collects inpatient (IP) and emergency department (ED) administrative claims or electronic health record (EHR) data from participating hospitals. This dataset includes information captured during a hospital visit such as diagnoses, services provided at the hospital, and discharge status. The 2019 NHCS data are not nationally representative; however, plans are the 2020 NHCS will be weighted to allow for national estimates to be produced. For general information about the NHCS, see: <https://www.cdc.gov/nchs/nhcs/index.htm>. For information on the 2019 and 2020 NHCS data available in the RDC, see: <https://www.cdc.gov/rdc/data/b1/2019-2020-NHCS-RDC-Data-Dictionary-508.pdf>.

INFORMATION ABOUT THE 2020 NHCS ENHANCED OPIOID- IDENTIFICATION VARIABLES

The encounter-level file of the NHCS Enhanced Opioid Identification Dataset identifies opioid-involved hospital encounters in the ED and IP settings. The file was created using the Enhanced Opioid Identification algorithm that searched the 2019 and 2020 NHCS dataset for opioid-involved encounters using medical codes and machine learning techniques. The code component of the algorithm searched for opioid involved diagnosis, medication, procedure, service, and laboratory codes. The Natural Language Processing (NLP) component of the enhanced algorithm identified opioid-involved encounters mentioned in the clinical notes. Detailed information on the methodology for the development of the Enhanced Opioid Identification Algorithm is described in the following report:

https://www.cdc.gov/nchs/data/series/sr_02/sr2-188.pdf.

Opioid Definition and Search Terms

Opioids are defined as natural opioids, semi-synthetic opioids, prescription synthetic opioids, illicit opioids, and substances that produce opioid-like effects. *Opioid-involvement* is defined as search terms or medical codes that indicate opioid use prior to hospital arrival, opioids administered during the hospital stay, or opioids prescribed upon discharge. *Opioid-overdoses* were identified using T40 International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) codes, or F11 use/abuse/dependence ICD-10-CM codes or from opioid-overdose search terms found in the clinical notes using NLP methods. Opioid-overdoses mentioned during the survey year were included in the analysis. Overdoses that occurred prior to survey years were excluded. Refer to the Appendix I – VIII for the complete code and search terms lists.

The final medication lists incorporated opioid search terms from the Drug Involved Mortality (DMI) Principal Variant list, the National Electronic Injury Surveillance System – Cooperative Adverse Drug Event Surveillance Project (NEISS-CADES), and the University of Kentucky’s Enhanced State Opioid Overdose Surveillance (ESOOS) drug terms and queries. The list includes opioid medication brand names, generic names, metabolites, illicit opioids and their street names, acronyms, and misspellings. The final list was used in both the coded and NLP algorithms.

An interdisciplinary team of clinicians, researchers, and analysts collated the medical codes and search terms and mapped them to 13 frequently-used opioids and opioid-antagonists (listed below). Opioids that did not map to the 13 categories were identified as other opioids (OTH_OPIOID), and their names listed as free text and multiple substances are delimited by semicolons (OTHER_OPIOID_LIST). General mentions of opioids (e.g., “opiate,” “narcotic,” etc.) were mapped as “unspecified opioids” (UNSPECIFIED_OPIOID).

- Buprenorphine/Norbuprenorphine
- Codeine
- Fentanyl/Fentanyl analogs
- Heroin
- Hydrocodone
- Hydromorphone
- Levorphanol
- Meperidine
- Methadone
- Morphine
- Oxycodone
- Oxymorphone
- Tramadol
- Unspecified opioid
- “Other” opioid
- Naltrexone
- Naloxone

Code Component

The code component of the Enhanced Opioid Identification Algorithm identified opioids, opioid antagonists, and opioid-involved overdoses from the medical codes and labels of diagnoses codes, medication codes, services codes, and laboratory codes with positive results. The code systems used to identify opioid-involved encounters are ICD-10-CM codes for diagnoses, RxNORM and Systematized Nomenclature of Medicine (SNOMED) codes for medications, International Classification of Diseases, Tenth Revision, Procedure Classification System (ICD-10-PCS), and Healthcare Common Procedure Coding System (HCPCS) for services/procedures, and Logical Observation Identifiers Names and Codes (LOINC) codes to identify positive opioid-involved laboratory screens. See the Appendix I-V for the list of codes included in the algorithm.

Keyword searches of the medical code labels are part of the coded algorithm because the labels are standardized within their respective code systems. Using this assumption, the search terms were limited to the correct spellings of

opioid search terms. Keyword search was also used to identify positive or confirmatory qualitative laboratory results (e.g., “positive,” “pos,” “confirmed,” etc). LOINC codes without a positive result were identified as an opioid-involved encounter.

Machine Learning and Natural Language Processing Component

The machine learning and NLP component of the Enhanced Opioid Identification Algorithm identifies opioid-involved encounters mentioned in the clinical notes available in the 2019 and 2020 NHCS data. Only EHR data sources with clinical notes are included in the NLP analysis.

The NLP algorithm used Named Entity Recognition (NER) techniques and an existing opioid-search term list to detect opioid-involved encounters (see Appendix VII -VIII for search term list). NER is an NLP approach that searches for opioids by learning what words resemble opioid search terms. The search term list and NER were used together to identify exact matches from the opioid list and possible matches from the NER. The list of possible matches was manually reviewed by clinicians and researchers to determine if the possible matches were truly opioids. This approach allowed the NER to capture opioid medications and novel misspellings that were not included in search term lists.

The NER could also exclude encounters that fell outside the definition of “opioid-involved”. The program was able to detect terms and phrases in the notes that negated opioid use (e.g. “did not use”). In addition, the NER also recognized dates embedded in the notes and identified opioid mentions that were outside the analysis time period. Opioids that were negated were reviewed and removed from the final NLP output.

In addition, the NER was also used to detect opioid overdoses. Once an overdose mention was detected, NER would search the surrounding text for an illicit or licit opioid search term. Notes that detected a negated drug mention, a non-opioid drug, or detected no drug mentions were not classified as an opioid overdose.

2020 NHCS Enhanced Opioid-Identification Variables

The encounter level file includes variables for 13 opioids, two opioid antagonists, and non-specific mentions of opioids. The value of the variables is binary, where a one (1) indicates there was an opioid identified in the hospital

encounter from the enhanced algorithm, and a zero (0) indicates the opioid was not identified by the algorithm.

Additional variables identify whether the opioids were identified using NLP, opioids identified using codes/free text search, drug overdoses identified by NLP, and drug overdoses identified by codes/free text search. Table 1 details the number of encounters that were identified as opioid-involved in the 2019 and 2020 NHCS, while Table 2 identifies the number of encounters that had a mention of an opioid or opioid antagonist of interest. Note, Table 2 includes opioid-involved encounters and encounters that are not opioid-involved but have a mention of opioid antagonists naloxone and naltrexone.
