Overview

The National Program of Cancer Registries (NPCR), administered by the Centers for Disease Control and Prevention (CDC), was established by Congress in 1992. Through cooperative agreements, NPCR supports central cancer registries in 46 states, the District of Columbia, Puerto Rico, the U.S. Pacific Island Jurisdictions, and the U.S. Virgin Islands. Every year since 2000, the NPCR central cancer registries have been submitting relevant demographic and clinical information about each diagnosed cancer case to CDC.

CDC works closely with a variety of partners to deliver and manage this cancer surveillance system. One of CDC’s most critical partners is the National Cancer Institute (NCI), which funds the Surveillance, Epidemiology, and End Results (SEER) Program. Together, CDC’s NPCR and NCI’s SEER programs cover the entire United States population.

The programs’ combined data are referred to as the U.S. Cancer Statistics (USCS) and they are the official source of federal statistics on cancer incidence. U.S. Cancer Statistics data are available to the public through various data products, including the U.S. Cancer Statistics Data Visualizations tool and public use database; external researchers have additional access to U.S. Cancer Statistics through the U.S. Cancer Statistics Restricted Access Data Set.

The U.S. Cancer Statistics Restricted Access Data Set is available to researchers in a SAS file at CDC’s National Center for Health Statistics (NCHS) Research Data Centers (RDC) and Federal Statistical Researcher Data Centers. Researchers must complete a proposal and if the project is approved, adhere to RDC procedures for accessing the restricted data. Refer to the RDC website for details.

Available Data

This file documents the data items included in the U.S. Cancer Statistics Restricted Access Data Set, 1998-2016.

The purpose of this document is to define data standards for data items included in the U.S. Cancer Statistics Restricted Access Data Set (RADS) of the CDC’s National Program of Cancer Registries (NPCR) Cancer Surveillance System (CSS) and NCI’s Surveillance, Epidemiology,
and End Results (SEER) Program. These variables are routinely collected through NPCR and
SEER, and are defined by the North American Association of Central Cancer Registries
(NAACCR). The following document describes the data items.

For all variables defined by NAACCR standards, abstractors use NAACCR’s Standards for
Cancer Registries, Volume II: Data Standards and Data Dictionary, in use for the given
diagnosis year.

The data come from the 2018 NPCR-Cancer Surveillance System (NPCR-CSS) and SEER
submissions.

- NPCR allowed an interval of 23 months after the close of the diagnosis year (data
  submission by November 30, 2018), and
- SEER allowed an interval of 22 months after the close of the diagnosis year (data
  submission by November 1, 2018).

For the list of central cancer registries available for analysis by year, please see Figure 1. The
percent of cases covered by U.S. Cancer Statistics-eligible registries are listed below. If the year
range you are analyzing is not listed, please e-mail CDC at usesdata@cdc.gov and we will provide you
the percentage.

- 1998-2016: 94.3%
- 1999-2016: 97.8%
- 2001-2016: 99.0%
- 2004-2016: 100%
- 2007-2016: 100%
- 2012-2016: 100%.

</tbody>
</table>
2005: All registries met the publication criteria (50 U.S. States, D.C., and Puerto Rico).
2004: All registries met the publication criteria (50 U.S. States and D.C.).
2003: All registries met the publication criteria (50 U.S. States and D.C.).
2002: All registries met the publication criteria except Mississippi. Counts and rates cover approximately 99% of the U.S. population (49 U.S. States and D.C.).
2001: All registries met the publication criteria: data are not available for Mississippi. Counts and rates cover approximately 99% of the U.S. population (49 U.S. States and D.C.).
2000: All registries met the publication criteria except Arkansas; data are not available for Mississippi and South Dakota. Counts and rates cover approximately 98% of the U.S. population (47 U.S. States and D.C.).
1999: All registries met the publication criteria except Arkansas; data are not available for Mississippi and South Dakota. Counts and rates cover approximately 98% of the U.S. population (47 U.S. States and D.C.).
1998: All registries met the publication criteria except Arkansas, Georgia, and New Hampshire; data are not available for Mississippi, South Dakota, and Tennessee. Counts and rates cover approximately 92% of the U.S. population (44 U.S. States and D.C.).

In fall 2005, hurricanes Katrina and Rita hit the gulf coast and caused dramatic population shifts in the region. The US Census Bureau has provided estimates of the displaced populations within the four states of Alabama, Louisiana, Mississippi, and Texas. The adjusted US Census population estimates should be used; county-level populations in the four hurricane-affected states should be adjusted to account for evacuations and that portion of the population be put into a “dummy” state (otherwise known as the KR area) for 2005.

Cautionary Notes

Before using this database, analysts should read and understand the following section. If you have questions regarding these notes, please contact CDC at uscsdata@cdc.gov.

State Inclusion

Note that data from all registries are not represented each year. Data from each registry must meet eligibility criteria for inclusion in U.S. States Cancer Statistics to be included in this dataset and a state may be included for some years but not for all. States are also given the right to opt out of including their data in the dataset. Examine the table of state by year of diagnosis prior to beginning your analysis. See the Excel file referenced above. See the U.S. Cancer Statistics Eligibility Criteria section for more information on the criteria.
Four user-specified variables are included in the database: uscs9816, uscs9916, uscs0716, and uscs1216, for analyses using grouped years of data. These are particularly important for trend analyses, where the same states need to be included for each year under investigation. These user-specified variables contain all registries meeting U.S. Cancer Statistics criteria for all years included in the name of each variable (for example, uscs1216 includes states that have data available for all five years, 2012 through 2016). Additionally, the variable, USCS Standard, is to be used for single year analyses.

Case Inclusions

NPCR- and SEER-supported cancer registries report all incident cases coded as *in situ* (non-malignant) and invasive (malignant; primary site only) according to the *International Classification of Diseases for Oncology, Third Edition* (ICD-O-3), with the following exceptions—

- *In situ* cancers of the cervix are not reported.
- Basal and squamous cell carcinomas of the skin are not reported, except when these occur on the skin of the genital organs.
- Non-malignant (including borderline and *in situ*) central nervous system tumors are reported.
- *In situ* cancers of the urinary bladder are re-coded as invasive behavior and SEER Summary Stage *in situ* because the information needed to distinguish between *in situ* and invasive bladder cancers is not always available or reliable.¹

Suppression Rules²⁻³

Complementary Cell Suppression

When analyzing data at the state or regional levels, counts for national and regional data must be suppressed if a single state in a region or division is suppressed. This practice is referred to as complementary cell suppression and is necessary to prevent users from subtracting to find suppressed counts. Rates, confidence intervals (CIs), and populations can be shown at the national and regional levels. This suppression should occur when a single or multiple years of data are being presented.

Suppressing fewer than 16 cases

The suppression rule is <16 cases for the time period based on rate stability. When the numbers of cases used to compute the incidence rates are small, those rates tend to have poor reliability. Therefore, to discourage misinterpretation and misuse of counts, rates, and trends that are unstable because of the small number of cases or deaths, these statistics are not shown in tables and figures if the counts are fewer than 16 for the time period. A count of less than
approximately 16 in a numerator results in a standard error of the rate that is approximately 25% or more as large as the rate itself. Equivalently, a count of less than approximately 16 results in the width of the 95% confidence interval around the rate being at least as large as the rate itself. These relationships were derived under the assumption of a Poisson process and with the standard population age distribution close to the observed population age distribution.

Another important reason for employing a cell suppression threshold value is to protect the confidentiality of patients whose data are included in a report by reducing or eliminating the risk of identity disclosure. The cell suppression threshold value of 16 is recommended to protect patient confidentiality given the low level of geographic and clinical detail provided.

**Reporting Delay**

Note that data are resubmitted by each NPCR and SEER registry each year. New cases are added each year to previous years resulting in a reporting delay. Cases may also be deleted from older years. Cases for certain primary sites e.g., melanoma and prostate, that are diagnosed on an outpatient basis can appear to be dropping in the most recent year.

**Race and Ethnicity**

*Data Suppression*

States have the option to suppress race-specific and Hispanic ethnicity–specific data every submission year. While these states can be included in an aggregated analysis, the affected state’s race and ethnicity information cannot be reported at the state level.

- The variable, `state race eth suppress`, can be used to restrict your analysis to the states that are eligible to be included in a state- or county-level analysis of race and ethnicity.

- If the variable, `state race eth suppress`, is not used and state- or county-level data are being reported, the following suppressions must be made when using data from the 2018 submission:
  - Hispanic ethnicity data cannot be displayed for Delaware, Kentucky, and Massachusetts.
  - Data for American Indians and Alaska Natives (AI/AN) cannot be displayed for Delaware, Illinois, Kansas, Kentucky, New Jersey, and New York.
  - Data for Asian and Pacific Islanders (API) cannot be displayed for Delaware, Kansas, and Kentucky.
Any race and ethnicity combinations—for example, white Hispanic, white non-Hispanic, black Hispanic, black non-Hispanic—cannot be displayed for Delaware, Kansas, Kentucky, Massachusetts and Pennsylvania.

Race Recode variable

This variable is created from Race1, Race2, and the Indian Health Service Link variable (IHS Link). Race/ethnicity starts as Race1. If Race1 is white and Race2 is a specified non-white race, then the value from Race2 is used. After this check, if Race/ethnicity is still white and there is a positive IHS Link, then Race/Ethnicity is set to American Indian/Alaskan Native.

The race recode variable contains an “other unspecified category”. This group is treated as unknown race for the purpose of analyses as per the SEER documentation. Population data are not available for the other and unknown race categories.

Indian Health Service-linked American Indian/Alaska Natives (AI/AN) data

IHS provides medical services to AI/ANs who are members of federally recognized tribes, estimated to be about 65% of the AI/AN population. To improve identification of AI/ANs, 32 NPCR registries with Purchase/Referred Care Delivery Area (PRCDA) counties in their state annually link with the IHS patient registration database to identify AI/ANs who had not been coded as AI/AN (see “IHS Link” variable description). All NPCR registries link every five years. Linkages were performed by all NPCR registries most recently in 2011 and 2016 (cases diagnosed 1995-2016). In 2018, some, but not all, NPCR registries linked cancer cases diagnosed from 1995-2016; SEER registries linked cancer cases diagnosed from 1994-2016.

- When interpreting data results, be aware that AI/AN populations may be undercounted during years when linkages did not occur in all NPCR registries.
- If a project is looking specifically at AI/AN populations, analysts may consider restricting the analysis to registries that conduct annual IHS linkages.

The race recode variable contains Indian Health Service (IHS)-linked American Indian data.

Sex

When analyzing sex-specific cancers (such as prostate cancer or female breast cancer), the analysis should be limited to the appropriate sex to get the correct population denominator (e.g. only women or only men).

County

County data may be used only in approved analyses and in the following ways: a) used as a linkage variable only by the NCHS RDC analyst; b) included as a confounder or other control
variable, but no data are presented by county; c) used in geographically aggregated form such as large metropolitan statistical areas (e.g., those with a population of 1 million or later), multi-county regions, or geographical areas (e.g., Appalachia or IHS Contract health Services Delivery Areas (CHSDA) counties). States are given the right to suppress county-specific data every submission year.

Stage

A merged variable, *Merged Summary Stage*, has been created to span four time periods when three different staging schemes were used. Stage at diagnosis is recorded using *SEER Summary Stage 1977* for diagnosis years 1998-2000, *SEER Summary Stage 2000* for diagnosis years 2001–2003 and *Derived SEER Summary Stage 2000* for diagnosis years 2004–2015 (NPCR), and *SEER Summary Stage 2000* for diagnosis year 2016 (NPCR). Derived SEER Summary Stage 2000 is used for diagnosis years 2004-2016 for SEER states.

The coding logic for this merged variable is:

- If a case was diagnosed between 1998 and 2000, stage at diagnosis is recorded using the *SEER Summary Stage 1977* variable value.
- If a case was diagnosed between 2001 and 2003, stage at diagnosis is recorded using the *SEER Summary Stage 2000* variable value.
- If a case was diagnosed between 2004 and 2015 and it was reported to an NPCR registry, then the stage at diagnosis is recorded using the *Derived SEER Summary Stage 2000* variable value.
- If a case was diagnosed in 2016 and it was reported to an NPCR registry, then the stage at diagnosis is recorded using the *SEER Summary Stage 2000*.
- If a case was diagnosed between 2004 and 2016 and it was reported by a SEER registry (Connecticut, Hawaii, Iowa, or New Mexico), then the stage at diagnosis is recorded using the *Derived SEER Summary Stage 2000* variable value.
- If the *Derived SEER Summary Stage 2000* variable is blank and a valid value is available for the *SEER Summary Stage 2000* variable, that value is used to populate the merged variable. For example, if a case was diagnosed in 2013 and *Derived SEER Summary Stage 2000* was blank, but *SEER Summary Stage 2000* had a value of local, then the merged variable was coded as local stage. Otherwise, the merged variable is left blank for that record.

*Merged Summary Stage 2000* variable is recommended for analyses that included cases diagnosed between 2001 and 2016. If your analysis includes cases diagnosed between 1998 and 2000, review the [NAACCR documentation](https://naaccr.org/) on changes from Summary Stage 1977 and Summary Stage 2000 before using the *Merged Summary Stage 2000* variable.

If the *Merged Summary Stage 2000* variable is not used, then the following variable history should be noted:
• The individual Collaborative Stage data elements began to be collected in diagnosis year 2004.
  o Derived Summary Stage 2000 variable should be used with 2004-2015 NPCR cases and 2004-2016 SEER-only cases.
  o Summary Stage 2000 should be used with 2001-2003 and 2016 NPCR cases; it should be used with 2001-2003 SEER-only cases.
  o Summary Stage 1977 should be used with 1998-2000 cases.
• For primary sites where the coding instructions changed to redistribute the percentage of cases coded as localized, regional, and distant, analyses should be limited to 2001 cases and forward. See the NAACCR “Site-Specific Comparison of Summary Stage 1977” for specific information.

Primary Site Variables

Beginning in diagnosis year 2010, some of the lymphoma and leukemia ICD-O-3 codes were updated based on changes from the World Health Organization. The appropriate site recode variables to include these updates are Site recode ICD-O-3/WHO 2008 for all ages and International Classification of Childhood Cancer (ICCC) site recode ICD-O-3/WHO 2008 and ICCC site rec extended ICD-O-3/WHO 2008 for the childhood cancer recodes.

If the standard primary site recode variable is not used and a user-defined primary site variable is created, leukemias and lymphomas (9590-9989) should be excluded. Users may also want to break out Kaposi sarcoma (9140) and mesothelioma (9050-9055). For more information on the SEER primary site recode, see http://seer.cancer.gov/siterecode/.

Benign Central Nervous System (CNS) Tumors

Cancer registries began collecting information on nonmalignant brain and other nervous system tumors beginning with 2004 diagnoses. Collection of these tumors is in accordance with Public Law 107–260, the Benign Brain Tumor Cancer Registries Amendment Act, which mandates that NPCR registries collect data on all brain and other nervous system tumors with a behavior code of 0 (benign) and those with a behavior code of 1 (borderline), in addition to in situ and malignant. SEER registries voluntarily agreed to incorporate registration of these tumors in their standard practices. Data for nonmalignant brain and other nervous system tumors were available from all registries contributing to this report.

Histology

For analyses that include histology, your analysis should be restricted to cases where Diagnostic Confirmation is “microscopically confirmed”. This restriction will additionally exclude the death certificate only (DCO) cases.
**Behavior**

- ICD-O-2 behavior coding was used for cases diagnosed between 1992 and 2000 (1998-2000 in this data set). Cases diagnosed January 1, 2001 and after use the ICD-O-3 classification system. ICD-O-2 cases were converted to ICD-O-3 before they were submitted for this data set.

- If the analysis only includes cases diagnosed in 2001 or later, use the variable *Behavior code ICD-O-3*.

- If the analysis includes cases diagnosed in 1998, 1999, and/or 2000, and also spans diagnosis years ≥2001, then use the variable, *Behavior recode for analysis*. This variable reconciles the differences between ICD-O-2 and ICD-O-3. The ICD-O-3 manual, Appendix 6, has a complete list of behavior code changes.

**Histologic Type ICD-O-3**

**Data Citation**

The following standard citations are to be used for all tables and figures when presented in presentations or publications.

- **For population coverage:** Data are from population-based registries that participate in the National Program of Cancer Registries or Surveillance, Epidemiology, and End Results Program and meet high-quality data criteria. These registries cover approximately [XX]% of the U.S. population.

- **For age-adjusted rates:** Rates are per 100,000 persons (or per 100,000 men or per 100,000 women, if sex-specific cancer) and are age-adjusted to the 2000 U.S. standard population (19 age groups – Census P25–1130).

- **For the U.S. Cancer Statistics Restricted Access Data Set:** National Program of Cancer Registries and Surveillance, Epidemiology, and End Results SEER*Stat Database: U.S. Cancer Statistics Restricted Access Data Set, November 2018 submission

---

² If the year range you are analyzing is not listed on page 4 of this document, please e-mail CDC at uscsdata@cdc.gov and we will provide you the percentage.
U.S. Cancer Statistics Eligibility Criteria

After years of analyzing completeness of case ascertainment, we have determined that our registries consistently deliver high quality, complete data. We have discontinued using completeness of case ascertainment calculations as a measure of eligibility for publication. The data quality criteria—missing/unknown data, death certificate only percentage, duplicate rate, and percent records passing edits—will continue to be used in determining inclusion. Even though the completeness estimate will no longer be a criterion for U.S. Cancer Statistics, we will continue to use this estimate to monitor and evaluate progress in meeting NPCR Program Standards.

Cancer registries in the “meets uscs criteria” category for each year and for groups of years at the Regional Level meet the following data quality criteria for all cancer sites combined:

- **No more than 5% of cases are ascertained solely on the basis of a death certificate.** The proportion of cases ascertained solely on the basis of a death certificate, with no other information on the case available after the registry has completed a routine procedure known as “death clearance and followback,” is another measure of the completeness of case ascertainment.

- **No more than 3% of cases are missing information on sex.**

- **No more than 3% of cases are missing information on age.**

- **No more than 5% of cases are missing information on race.**

- **At least 97% of the registry’s records passed a set of single-field and interfield computerized edits.** Computerized edits are computer programs that test the validity and logic of data components. For example, if (a) a patient received a diagnosis of cancer in 1999, (b) the patient’s age was reported as 80 years, and (c) the patient’s year of birth was reported as 1942, a computerized edit could, without human intervention, identify these components as incompatible. The computerized edits applied to the data in this report are incorporated into NAACCR standards (http://www.naaccr.org) and into the EDITS software designed and maintained by CDC (http://www.cdc.gov/cancer/npcr/tools/edits/).

The measurement error for these criteria may vary in select circumstances, following review by CDC and/or NCI.

</tbody>
</table>

Description

Code for the county of the patient’s residence at the time the tumor was diagnosed. For U.S. residents, standard codes are those of the FIPS publication “Counties and Equivalent Entities of the United States, Its Possessions, and Associated Areas.” If the patient has multiple tumors, the county codes may be different for each tumor.

Codes

3-character value ranging from 001 to 998.

Codes need to be used in combination with I80_StateDx.

In addition to FIPS and Geocodes:

- 000 United States, Not Otherwise Specified
- 999 County unknown

Considerations for use

County data will be used only in approved analyses and in the following ways: a) used as a linkage variable (linkage to census data, for example) only by the NCHS RDC analyst; b) included as a confounder or other control variable, but no data are presented by county; c) used in geographically aggregated form such as large metropolitan statistical areas (e.g., those with a population of 1 million or larger), multi-county regions, or geographical areas (e.g., Appalachia or IHS Contract Health Services Delivery Areas (CHSDA) counties).

Kansas and Minnesota did not allow permission for their county data to be used. The County at Diagnosis variable for these states has been recoded to 000 for all diagnosis years.

See the NAACCR data dictionary, Appendix A for standard FIPS county codes.
Section: Demographic Data Items
USCS Standard

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>USCSSTD</td>
<td>1</td>
<td>NPCR</td>
</tr>
</tbody>
</table>

Description
This variable indicates the NPCR-funded central cancer registries with cancer incidence data that are of high quality and meet the U.S. Cancer Statistics standard for a single year of analysis at the national level for all cancer sites combined.

Codes
1-character value

*Note: USCSSTD = 1 if the state met USCS standards for specific DxYear. If the state didn’t meet USCS standards for specific DxYear, this state is excluded from the U.S. Cancer Statistics Restricted Access Data Set.*

Considerations for use
- This variable allows the selection of only those central cancer registries whose data meet the U.S. Cancer Statistics standard for an individual diagnosis year.
- If you are conducting a multiyear analysis and want to restrict the analysis to the states that met publication criteria for each of those years (for example, a trend analysis), we recommend using the predefined variables, USCS1216 (includes diagnosis years 2012–2016), USCS0616 (includes diagnosis years 2006–2016), USCS9916 (includes diagnosis years 1999-2016) or USCS9816 (includes diagnosis years 1998–2016).
**Section: Demographic Data Items**

**USCS9916**

<table>

<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>USCS9916</td>
<td>1</td>
<td>NPCR</td>
</tr>
</tbody>
</table>

**Description**

This variable indicates whether NPCR-funded central cancer registries met the U.S. Cancer Statistics publication standard for all cancer sites combined each year in 1999–2016. When using this variable, restrict the diagnosis years to 1999–2016.

**Codes**

1-character value

1  state met USCS standards for each DxYear in 1999-2016

0  state didn’t meet USCS standards for each DxYear in 1999-2016

**Considerations for use**

- This variable is used for analysis of combined 1999–2016 data in the 1998–2016 database. Data from states that did not meet the U.S. Cancer Statistics publication standard in any given year were excluded from the database for that year. Please refer to the population coverage Excel file for the list of states by year that were included and excluded by this variable.

- If you are conducting a multiyear analysis and want to restrict the analysis to the states that met publication criteria for each of those years (for example, a trend analysis), we recommend using the predefined variables, USCS1216 (includes diagnosis years 2012–2016), USCS0616 (includes diagnosis years 2007–2016), USCS9916 (includes diagnosis years 1999-2016) or USCS9816 (includes diagnosis years 1998–2016).

</table>

Description
The region where the patient lived at diagnosis.

The NAACCR data item Address at Diagnosis—State [80] is recoded into one of the four Census regions, the same definition used for region in United States Cancer Statistics. Reference [http://www.census.gov/geo/www/us_regdiv.pdf](http://www.census.gov/geo/www/us_regdiv.pdf) for a list of states for each region.

Codes
- Midwest
- Northeast
- South
- West

Considerations for Use
Do not confuse this variable with census tract. Census tract data are not included in this dataset.
Section: Demographic Data Items

Race 1

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I160_Race1</td>
<td>2</td>
<td>NAACCR Item #160</td>
</tr>
</tbody>
</table>

Description

Code for the patient’s race. Race is coded separately from Spanish/Hispanic Origin [190]. All tumors for the same patient should have the same race codes. If the patient is multiracial, a second race is coded in the data item RACE 2 [161]. For coding instructions and race code history see the current SEER Program Coding and Staging Manual. Reference to Census 2000 definitions for ethnicity and race: http://www.census.gov/prod/cen2000/doc/sf2.pdf

Rationale

Because race has a significant association with cancer rates and outcomes, a comparison between areas with different racial distributions may require an analysis of race to interpret the findings. The race codes listed correspond closely to race categories used by the U.S. Census Bureau to allow calculation of race-specific incidence rates. The full coding system should be used to allow accurate national comparison and collaboration, even if the state population does not include many of the race categories.

Codes

01 White
02 Black
03 American Indian, Aleutian, or Eskimo (includes all indigenous populations of the Western hemisphere)
04 Chinese prior to Version 12
05 Japanese
06 Filipino
07 Hawaiian
08 Korean
10 Vietnamese
11 Laotian
12 Hmong
13 Kampuchean (Cambodian)
14 Thai
15 American Indian or populations of the Western hemisphere
16 Asian Indian
17 Pakistani
18 Micronesian, NOS
19 Chamorro/Chamoruan
20 Guamanian, NOS
21 Micronesian, NOS
22 Micronesian, NOS
25 Polynesian, NOS
26 Tahitian
27 Samoan
28 Tongan
30 Melanesian, NOS
31 Fiji Islander
32 New Guinean
96 Other Asian, including Asian, NOS and Oriental, NOS
97 Pacific Islander, NOS
98 Other
99 Unknown

Considerations for Use

Population data are not available for this variable. For age-adjusted rates by race, “NPCR Race Recode” should be used. This variable is used to derive the “NPCR Race Recode”.

The following states have state-level race data presentation restrictions:

- Data for American Indians and Alaska Natives cannot be displayed for Delaware, Illinois, Kansas, Kentucky, New Jersey, and New York.
• Data for Asians and Pacific Islanders cannot be displayed for Delaware, Kansas and Kentucky.
• Data for race and ethnicity combinations—white Hispanic, white non-Hispanic, black Hispanic, and black non-Hispanic—cannot be displayed for Delaware, Kansas, Kentucky, Massachusetts, and Pennsylvania.

### Considerations for Use

Population data are not available for this variable. For age-adjusted rates by race, “NPCR Race Recode” should be used. This variable is used to derive the “NPCR Race Recode”.

The following states have state-level race data presentation restrictions:

- Data for American Indians and Alaska Natives cannot be displayed for Delaware, Illinois, Kansas, Kentucky, New Jersey, and New York.
• Data for Asians and Pacific Islanders cannot be displayed for Delaware, Kansas and Kentucky.
• Data for race and ethnicity combinations—white Hispanic, white non-Hispanic, black Hispanic, and black non-Hispanic—cannot be displayed for Delaware, Kansas, Kentucky, Massachusetts, and Pennsylvania.
Section: Demographic Data Items
Race Recode

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Race_Recode_For_USCS</td>
<td>8</td>
<td>Derived based upon NAACCR Items #160, #161, and #192</td>
</tr>
</tbody>
</table>

Description
The variable contains Indian Health Service-linked American Indian data. For this dataset, all NPCR cancer registries linked cancer cases diagnosed from 1995–2016 with the IHS patient registration database to identify American Indians/Alaska Natives that were classified in the registry as non-native. IHS provides medical services to American Indians/Alaska Natives who are members of federally recognized tribes, estimated to be approximately 65% of the American Indian/Alaska Native population. This variable is created from Race1, Race2, and the Indian Health Service (IHS) Link variable. Race/ethnicity starts as Race1. If Race1 is white and Race 2 is a specified non-white race, then the value from Race2 is used. After this check, if Race/ethnicity is still white and there is a positive IHS Link, then Race/Ethnicity is set to American Indian/Alaskan Native.

The “race recode” variable also contains an “other unspecified category”. This group is treated as unknown race for the purpose of analyses as per the SEER documentation. Population data are not available for the other and unknown race categories.

For further information on creating this variable, see the SAS statements in Appendix I.

Codes
See Appendix II for variable coding.

This variable combines race into the following categories:
- White
- Black
- American Indian/Alaska Native
- Asian/Pacific Islander
- Other
- Unknown
Section: Demographic Data Items
Spanish/Hispanic Origin

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>1190 SpanishOrigin</td>
<td>1</td>
<td>NAACCR Item #190</td>
</tr>
</tbody>
</table>

**Description**

Code identifying persons of Spanish or Hispanic origin. This code is used by hospital and central registries to show the “best guess” as to whether or not the person should be classified as Hispanic for purposes of calculating cancer rates. If the patient has multiple tumors, all records should have the same code.

Reference to Census 2000 definitions for ethnicity and race:

All information resources should be used to determine the correct code, including:

- Stated ethnicity in the medical record
- Stated Hispanic origin on the death certificate
- Birthplace
- Information about life history and/or language spoken found during the abstracting process
- Patient’s last name [2230] or maiden name [2390] found on a list of Hispanic names

Some registries code the information from the medical record, others code ethnicity based on Spanish names, and others use a combination of methods.

Persons of Spanish or Hispanic origin may be of any race, but these categories generally are not used for Native Americans, Filipinos, etc., who may have Spanish names. If a patient has a Hispanic name, but there is reason to believe they are not Hispanic (e.g., the patient is Filipino, or the patient is a woman known to be non-Hispanic who has a Hispanic married name), the code in this field should be 0 (non-Spanish, non-Hispanic).

Code 7 is assigned if Hispanic ethnicity is based strictly on a computer list or algorithm (unless contrary evidence is available).

*Note:* NAACCR recognizes that available definitions and abstracting instructions for Name--Last [2230] and Name--Maiden [2390] may be inadequate for describing names used in some cultures, including Hispanic cultures. Explicit instructions have not been provided for entering compound names, with or without hyphens or “De.” Order of names, use of maternal and paternal names, and use of hyphens can vary across cultures. It is likely that abstracting and coding practice for these items varies across registries. Limitations inherent in these definitions should be kept in mind when using the data.
Rationale
Ethnic origin has a significant association with cancer rates and outcomes. Hispanic populations have different patterns of occurrence of cancer from other populations that may be included in the “white” category of Race [160].

Codes

0  Non-Spanish; non-Hispanic
1  Mexican (includes Chicano)
2  Puerto Rican
3  Cuban
4  South or Central American (except Brazil)
5  Other specified Spanish/Hispanic origin (includes European; excludes Dominican Republic)
6  Spanish, NOS
   Hispanic, NOS
   Latino, NOS
   There is evidence, other than surname or maiden name, that the person is Hispanic, but he/she cannot be assigned to any of the other categories 1-5.
7  Spanish surname only ((Code 7 is ordinarily for central registry use only, hospital registrars may use code 7 if using a list of Hispanic surnames provided by their central registry; otherwise, code 9 “unknown whether Spanish or not” should be used.)
   The only evidence of the person’s Hispanic origin is the surname or maiden name and there is no contrary evidence that the person is not Hispanic.
8  Dominican Republic
9  Unknown whether Spanish or not

Note: Code 7 was adopted for use effective with 1994 diagnosis and modified December 1994.

Note: Code 8 was added in Standards Volume II Version 10.2, effective January 2005, however, abstractors may assign code 8 to tumors diagnosed prior to 2005.

Considerations for Use
Due to concerns about under-reporting of Hispanics, the NHIA variable [191] was created to identify Hispanics in 2004. Population data are not available for this variable. For age-adjusted rates by ethnicity, the variable “Origin recode NHIA (Hispanic/Non-Hispanic)” should be used.

The following states have state-level race or ethnicity data presentation restrictions:
• Data for Hispanic ethnicity cannot be displayed for Delaware, Kentucky, and Massachusetts.
• Data for race and ethnicity combinations—white Hispanic, white non-Hispanic, black Hispanic, and black non-Hispanic—cannot be displayed for Delaware, Kansas, Kentucky, Massachusetts, and Pennsylvania.
Section: Demographic Data Items
NHIA Derived Hispanic Origin

NHIA Derived Hispanic Origin

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I191_NHIA</td>
<td>1</td>
<td>NAACCR Item #191</td>
</tr>
</tbody>
</table>

Description
The NAACCR Hispanic Identification Algorithm (NHIA) uses a combination of standard variables to directly or indirectly classify cases as Hispanic for analytic purposes. It is possible to separate Hispanic ancestral subgroups (e.g., Mexican) when indirect assignment results from birthplace information but not from surname match. The algorithm uses the following standard variables: Spanish/Hispanic Origin [190], Name--Last [2230], Name--Maiden [2390], Birthplace [250], Race 1 [160], IHS Link [192], and Sex [220].

Code 7 (Spanish surname only) of the Spanish/Hispanic Origin [190] data item became effective with 1994 diagnoses. For greater detail, please refer to the technical documentation: http://www.naaccr.org/dat#NHIA.

Rationale
Sometimes despite best efforts to obtain complete information directly from the medical record, information is not available and is reported to the cancer registry as a missing data item. With regard to Hispanic ethnicity, some cancer registries have found it necessary to rely on indirect methods to populate this data element. Registries often have significant numbers or proportions of Hispanic populations in their jurisdiction.

Codes
0  Non-Hispanic
1  Mexican, by birthplace or other specific identifier
2  Puerto Rican, by birthplace or other specific identifier
3  Cuban, by birthplace or other specific identifier
4  South or Central American (except Brazil), by birthplace or other specific identifier
5  Other specified Spanish/Hispanic origin (includes European; excludes Dominican Republic), by birthplace or other specific identifier
6  Spanish, NOS; Hispanic, NOS; Latino, NOS
7  NHIA surname match only
8  Dominican Republic
Blank Algorithm has not been run

Note: Code 8 was added in Standards Volume II Version 10.2 effective January 2005.

Considerations for Use
Blank values are allowed for states that chose not to include data for NHIA in this file. Data for NPCR registries that are included in U.S. Cancer Statistics use this variable. For age-adjusted
rates by ethnicity, the user-specified variable “Origin recode NHIA (Hispanic/Non-Hispanic)” should be used.

The following states have state-level race or ethnicity data presentation restrictions:
- Data for Hispanic ethnicity cannot be displayed for Delaware, Kentucky, and Massachusetts.
- Data for race and ethnicity combinations—white Hispanic, white non-Hispanic, black Hispanic, and black non-Hispanic—cannot be displayed for Delaware, Kansas, Kentucky, Massachusetts, and Pennsylvania.
Section: Demographic Data Items
IHS Link

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I192_IHS</td>
<td>1</td>
<td>NAACCR Item #192</td>
</tr>
</tbody>
</table>

**Description**
This variable captures the results of the linkage of the registry database with the Indian Health Service patient registration database.

**Rationale**
The IHS linkage identifies cancer cases among American Indians/Alaskan Natives who were misclassified as non-Indian in the registry database in order to improve the quality of cancer surveillance data on American Indians/Alaskan Natives in individual registries and in all registries as a whole. The goal is to improve cancer incidence data for American Indians/Alaskan Natives in the United States Cancer Statistics by use of this variable as well as the race variable.

**Codes**
- 0 Record sent for linkage, no IHS match
- 1 Record sent for linkage, IHS match
- Blank Record not sent for linkage or linkage result pending

**Considerations for Use**
- **This variable includes only count data.** Rates cannot be calculated using this variable as no population data are associated it.
- IHS provides medical services to American Indians and Alaska Natives (AI/ANs) who are members of federally recognized tribes, estimated to be about 65% of the AI/AN population. To improve identification of AI/ANs, 31 NPCR registries with Purchase/Referred Care Service Delivery Area (PRCSDA) counties in their state annually link with the IHS patient registration database to identify AI/ANs who had not been coded as AI/AN (shown in table below). All NPCR registries link every five years; linkages were performed by all NPCR states most recently in 2016. In 2016, SEER registries (Connecticut, Hawaii, Iowa, New Mexico) linked cancer cases diagnosed from 1994–2014.
  - When interpreting data results, be aware that AI/AN populations may be undercounted during years when linkages did not occur in all NPCR registries.
  - If a project is looking specifically at AI/AN populations, analysts may consider restricting the NPCR states included in the analysis to NPCR registries that conduct annual IHS linkages. See the table below for the list of these states.
- Those registries **not** included in the table below may elect to link with IHS annually, but are required to link every five years. Blank values are allowed for states without PRCDA

Page 35 of 110
counties that chose to not link with IHS annually or chose to not include data for American Indians/Alaskan Natives in this file.

- Population data are not available for this variable. For age-adjusted rates by race, the variable “NPCR Race Recode” should be used.

Table. NPCR Registries with one or more IHS PRCDA county.

</tr>
</thead>
<tbody>
<tr>
<td>Stateraceethincl</td>
<td>1</td>
<td>Derived based on NAACCR Item #192</td>
</tr>
</tbody>
</table>

Description
This variable was created specifically for this database. It provides the selection of states that are eligible to be included in a state-level analysis of race and ethnicity.

Codes
See Appendix II for variable coding.

Considerations for use
- States have the option to suppress race-specific and Hispanic ethnicity-specific data every submission year. While these states can be included in an aggregated analysis, the affected state’s race and ethnicity information cannot be reported at the state level.
- This variable should be used when conducting state-level analyses of race and ethnicity combinations. If you are conducting a state-level analysis of race- or ethnicity-only you should manually make restrictions rather than use this variable.
- The following states have state-level race or ethnicity data presentation restrictions:
  - Data for American Indians and Alaska Natives cannot be displayed for Delaware, Illinois, Kansas, Kentucky, New Jersey, and New York.
  - Data for Asians and Pacific Islanders cannot be displayed for Delaware, Kansas and Kentucky.
  - Hispanic ethnicity data cannot be displayed for Delaware, Kentucky, and Massachusetts.
  - Any race and ethnicity combinations—for example, white Hispanic, white non-Hispanic, black Hispanic, and black non-Hispanic—cannot be displayed for Delaware, Kansas, Kentucky, Massachusetts, and Pennsylvania.
- For more information, please refer to the “Race Recode for USCS” and “Origin recode NHIA (Hispanic, Non-Hisp)” variable descriptions in this document.
Section: Demographic Data Items

Sex

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I220_Sex</td>
<td>1</td>
<td>NAACCR Item #220</td>
</tr>
</tbody>
</table>

Description
Code for the sex of the patient.

Codes

1  Male
2  Female
3  Other (hermaphrodite)
4  Transsexual
9  Not stated/Unknown

Considerations for Use

- To get the correct population denominator, “female” must be selected when analyzing female-specific cancers (such as ovarian cancer or female breast cancer) and “male” for male-specific cancers (such as prostate cancer).
- Due to small case counts and the lack of an associated population file, cases for sex other than male or female are excluded from this database.
Section: Demographic Data Items
Age at Diagnosis

Age at Diagnosis

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I230 AgeDx</td>
<td>3</td>
<td>NAACCR Item #230</td>
</tr>
</tbody>
</table>

Description
Age of the patient at diagnosis in complete years.

Codes
3-character value

Considerations for Use
Population data are not available for this variable, therefore, rates cannot be calculated using this variable. When calculating rates, use the Age Recode variable. Age at diagnosis in complete years should only be used for special analyses; e.g. modeling.

Economic Status

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Econ_Status</td>
<td>4</td>
<td>Derived based upon NAACCR Item #90</td>
</tr>
</tbody>
</table>

Description

County level economic status variable as assigned by the Appalachian Regional Commission.

Codes

See Appendix II for variable coding.

Considerations for Use

1. **You MUST exclude Minnesota and Kansas when using this variable.** Caution should also be used with states that have missing county codes. We recommend running a frequency by states to find the number of missing counties (999).

2. **Distressed Designation and County Economic Status Classification System**

   The Appalachian Regional Commission (ARC) uses an index-based county economic classification system to identify and monitor the economic status of Appalachian counties. The system involves the creation of a national index of county economic status through a comparison of each county’s averages for three economic indicators—three-year average unemployment rate, per capita market income, and poverty rate—with national averages. The resulting values are summed and averaged to create a composite index value for each county. Each county in the nation is then ranked, based on its composite index value, with higher values indicating higher levels of distress.

3. **County Economic Levels**

   Each county is classified into one of five economic status designations, based on its position in the national ranking.

   1. **Distressed**
      
      Distressed counties are the most economically depressed counties. They rank in the worst 10 percent of the nation’s counties.

   2. **At-Risk**
      
      At-Risk counties are those at risk of becoming economically distressed. They rank between the worst 10 percent and 25 percent of the nation’s counties.

   3. **Transitional**
      
      Transitional counties are those transitioning between strong and weak economies. They make up the largest economic status designation. Transitional counties rank between the worst 25 percent and the best 25 percent of the nation’s counties.
4. **Competitive**

Competitive counties are those that are able to compete in the national economy but are not in the highest 10 percent of the nation’s counties. Counties ranking between the best 10 percent and 25 percent of the nation’s counties are classified competitive.

5. **Attainment**

Attainment counties are the economically strongest counties. Counties ranking in the best 10 percent of the nation’s counties are classified attainment.

4. A description of the source and methodology of the Appalachian Regional Commission is available at:

Section: Cancer Identification Data Items

Sequence Number – Central

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I380_SeqNoCntrl</td>
<td>2</td>
<td>NAACCR Item #380</td>
</tr>
</tbody>
</table>

Description

Code indicates the sequence of all reportable neoplasms over the lifetime of the person. Each primary neoplasm (not progression or recurrences) is assigned a different number. Sequence Number 00 indicates that the person has had only one in situ or one malignant neoplasm as defined by the Federal reportable list (regardless of central registry reference date). Sequence Number 01 indicates the first of two or more reportable neoplasms, 02 indicates the second of two or more reportable neoplasms, and so on. Because the time period of Sequence Number is a person’s lifetime, reportable neoplasms not included in the central registry (those that occur outside the registry catchment area or before the reference date) also are allotted a sequence number. For example, a registry may contain a single record for a patient with a sequence number of 02 because the first reportable neoplasm preceded the central registry’s reference date or was diagnosed and treated in another state.

Reporting Requirements: Federally Required and State/Province Defined

The Federal standard defining the reportable neoplasms is described in the NAACCR Volume II Data Standards and Data Dictionary Chapter III, Standards For Tumor Inclusion and Reportability. It is assumed that this shared standard is the “minimum” definition of reportability. Individual central cancer registries may define additional neoplasms as reportable. Numeric codes in the 00-59 range indicate the sequence of neoplasms of in situ or malignant behavior (2 or 3) at the time of diagnosis, which NPCR standards require to be reported. Codes 60 to 87 indicate the sequence of non-malignant tumors (as defined in Chapter III) and any other neoplasms that the central registry has defined as reportable. Neoplasms required by NPCR with an in situ or malignant behavior at the time of diagnosis are sequenced completely independently of this higher-numbered category.

Rationale

The purpose of sequencing based on the patient’s lifetime is to truly identify the 00s, the people who only had one malignant primary in their lifetime for survival analysis. If a central registry sequences by just what is reported to them, then it will be unclear whether 00 means the person only had one malignant primary in his lifetime or the person had one malignant primary since the central registry started collecting data. The Federally required reportable list has changed throughout the years, so the registry must use the appropriate reportable list for the year of diagnosis. The central registry reference date will not affect Sequence Number-Central.

Codes

*In Situ*/Malignant as Federally Required based on Diagnosis Year:

- 00 One primary in the patient’s lifetime
- 01 First of two or more primaries
02 Second of two or more primaries

..

59 Fifty-ninth or higher of fifty-nine or more primaries

99 Unspecified or unknown sequence number of federally required in situ or malignant tumors. Sequence number 99 can be used if there is a malignant tumor and its sequence number is unknown. If there is known to be more than one malignant tumor, then the tumors must be sequenced.

Non-malignant Tumor as Federally Required based on Diagnosis Year or State/Province Defined:

60 One non-malignant tumor or central registry-defined neoplasm

61 First of two or more non-malignant tumor or central registry-defined neoplasms

62 Second of two or more non-malignant tumor or central registry-defined neoplasms

..

88 Unspecified or unknown sequence number for non-malignant tumor or central registry-defined neoplasms. (Sequence number 88 can be used if there is a non-malignant tumor and its sequence number is unknown. If there is known to be more than one non-malignant

The table that follows shows which sequence number series to use by type of neoplasm.

<table>
<thead>
<tr>
<th>Neoplasm</th>
<th>SeqNum-Central</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>In Situ/Malignant as Federally Required based on Diagnosis Year</strong></td>

</tr>
<tr>
<td>Unspecified Non-malignant Tumor or Central Registry-Defined Sequence Number</td>
<td>88</td>
</tr>
<tr>
<td>Cervix CIS/CIN III, Diagnosis Year 1996-2002</td>
<td>98</td>
</tr>
</tbody>
</table>
*Juvenile astrocytomas should be reported as 9421/3.

Note: Conversion Guidance: The sequence numbers for neoplasms whose histologies were associated with behavior codes that changed from *in situ*/malignant to benign/borderline or vice versa during the conversion from ICD-O-2 to ICD-O-3 should not be re-sequenced.
## Section: Cancer Identification Data Items

### Date of Diagnosis

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I390 DateDX</td>
<td>6</td>
<td>Derived based upon NAACCR Item #390</td>
</tr>
</tbody>
</table>

### Description

Date of initial diagnosis by a recognized medical practitioner for the cancer being reported whether clinically or microscopically confirmed. This dataset contains records with a diagnosis year of 1998-2016.

### Codes

6-character date format: YYYYMM

### Considerations for Use

- The day of diagnosis is not provided for confidentiality reasons.
- Only valid portions of the date are included in this dataset.
- Below are the common formats to handle the situation where only certain components of date are known—
  - YYYYMM – when year and month are known and valid
  - YYYY – when year is known and valid, and month is unknown
  - Blank – when no known date applies
Section: Cancer Identification Data Items

Primary Site

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I400 Site</td>
<td>4</td>
<td>NAACCR Item #400</td>
</tr>
</tbody>
</table>

Description

Code for the primary site of the tumor being reported using ICD-O-3.

Codes

See Appendix II for coding

Considerations for Use

Consider reviewing the variables “Primary Site Recode” or “Primary Site Recode with Kaposi Sarcoma and Mesothelioma” before using the directly coded primary site. For more information on the SEER primary site recodes, see http://seer.cancer.gov/siterecode/.
Section: Cancer Identification Data Items
Laterality

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I410 Laterality</td>
<td>1</td>
<td>NAACCR Item #410</td>
</tr>
</tbody>
</table>

**Description**
Code for the side of a paired organ, or the side of the body on which the reportable tumor originated. This applies to the primary site only.

Starting with cases diagnosed January 1, 2004, and later, laterality is coded for select invasive, benign, and borderline primary intracranial and CNS tumors.

**Codes**

0  Not a paired site
1  Right: origin of primary
2  Left: origin of primary
3  Only one side involved, right or left origin unspecified
4  Bilateral involvement at time of diagnosis, lateral origin unknown for a single primary; or both ovaries involved simultaneously, single histology; bilateral retinoblastomas; bilateral Wilms tumors
5  Paired site: midline tumor (effective with 1/1/2010 dx)
9  Paired site, but no information concerning laterality
Section: Cancer Identification Data Items

Grade

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I440 Grade</td>
<td>1</td>
<td>NAACCR Item #440</td>
</tr>
</tbody>
</table>

Description

Code for the grade or degree of differentiation of the reportable tumor. For lymphomas and leukemias, field also is used to indicate T-, B-, Null-, or NK-cell origin.

Codes

Histologic Grading and Differentiation

1  Grade I  Well differentiated
       Differentiated, NOS
2  Grade II  Moderately differentiated
       Moderately well differentiated
       Intermediate differentiation
3  Grade III Poorly differentiated
4  Grade IV  Undifferentiated
       Anaplastic

Immunophenotype Designation for Lymphomas and Leukemias

5  T-cell
6  B-cell
7  Null cell
8  NK (natural killer) cell

Comment: Use the most recent hematopoietic and lymphoid rules for assigning grades 5-8.

9  Grade/differentiation unknown, not stated, or not applicable

Considerations for Use

The practice of grading varies greatly among pathologists throughout the world, and many malignant tumors are not routinely graded. Since different grading systems may be used, users should review the site-specific modules available at: http://training.seer.cancer.gov/modules_site_spec.html and the most current FORDS manual (http://www.facs.org/cancer/coc/fordsmanual.html). Each module has an abstracting, coding, and staging section, which has a morphology and grading sub-section. Some modules, but not all, contain notes about the grading system that may have been used to code grade. Currently, this dataset does not contain a variable to differentiate a specific grading system from another one if more than two grading systems are mentioned.
Diagnostic practices also influence coding practices. For example, preliminary analysis of tumor grade for prostate cancer showed an artificial increase in higher grade from 2002 to 2003. Additional review showed that the International Society of Urologic Pathologists (ISUP) in conjunction with the WHO made a series of recommendations for modification of the Gleason grading system to reflect contemporary knowledge, alleviate uncertainty, and promote uniformity in its application. One recommendation was for pathologists to report all higher tertiary grade components of the tumor as part of the Gleason score. Another recommendation was made for reporting of any higher grade cancer, no matter how small quantitatively. More information about grade migration is available:

1. Luthringer DJ, Gross M. Gleason Grade Migration: Changes in Prostate Cancer Grade in the Contemporary Era. *PCRI Insights* 2001; 9(3). Available at: [http://www.prostatecancer.org/education/staging/Luthringer_GleasonGradeMigration.html](http://www.prostatecancer.org/education/staging/Luthringer_GleasonGradeMigration.html).

Section: Cancer Identification Data Items
Diagnostic Confirmation

Diagnostic Confirmation

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I490_DxConf</td>
<td>1</td>
<td>NAACCR Item #490</td>
</tr>
</tbody>
</table>

Description
Code for the best method of diagnostic confirmation of the cancer being reported at any time in the patient’s history.

Rationale
Diagnostic confirmation is useful to calculate rates based on microscopically confirmed cancers. Full incidence calculations must also include tumors that are only confirmed clinically. The percentage of tumors that are not microscopically confirmed is an indication of whether case finding is including sources outside of pathology reports.

Codes

1  Positive histology  
2  Positive cytology  
3  Positive histology PLUS – positive immunophenotyping AND/OR positive genetic studies (Used only for hematopoietic and lymphoid neoplasms M-9590/3-9992/3)  
4  Positive microscopic confirmation, method not specified  
5  Positive laboratory test/marker study  
6  Direct visualization without microscopic confirmation  
7  Radiography and/or other imaging techniques without microscopic confirmation  
8  Clinical diagnosis only (other than 5, 6, or 7)  
9  Unknown whether or not microscopically confirmed; death certificate only

Note: Code 3 (used only for hematopoietic and lymphoid neoplasms M-9590/3-9992/3) was adopted for use effective with 2010 diagnoses.

Considerations for Use
None noted.
Section: Cancer Identification Data Items
Type of Reporting Source

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500_TypeRptSrc</td>
<td>1</td>
<td>NAACCR Item #500</td>
</tr>
</tbody>
</table>

**Description**

This variable codes the source documents used to abstract the majority of information on the tumor being reported. This may not be the source of original case finding (for example, if a case is identified through a pathology laboratory report review and all source documents used to abstract the case are from the physician’s office, code this item 4).

**Rationale**

The code in this field can be used to explain why information may be incomplete on a tumor. For example, death certificate only cases have unknown values for many data items, so one may want to exclude them from some analyses. The field also is used to monitor the success of non-hospital case reporting and follow-back mechanisms. All population-based registries should have some death certificate-only cases where no hospital admission was involved, but too high a percentage can imply both shortcomings in case-finding and that follow-back to uncover missed hospital reports was not complete.

**Considerations for Use**

Codes are assigned in the following priority order: 1, 2, 8, 4, 3, 5, 6, 7. This prioritizes laboratory reports over nursing home reports. The source facilities included in the code 1 (hospital inpatient and outpatient) were split in 2006 between codes 1, 2, and 8. Sources coded with ‘8’ would include, but would not be limited to, outpatient surgery and nuclear medicine services.

**Codes**

1. Hospital inpatient; Managed health plans with comprehensive, unified medical records
2. Radiation Treatment Centers or Medical Oncology Centers (hospital-affiliated or independent)
3. Laboratory only (hospital-affiliated or independent)
4. Physician’s office/private medical practitioner (LMD)
5. Nursing/convalescent home/hospice
6. Autopsy only
7. Death certificate only
8. Other hospital outpatient units/surgery centers
Section: Cancer Identification Data Items
Histologic Type ICD-O-3

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I522_HistTypeICDO3</td>
<td>4</td>
<td>NAACCR Item #522</td>
</tr>
</tbody>
</table>

Description
Codes for the histologic type of the tumor being reported using ICD-O-3. ICD-O-3 was adopted as the standard coding system for tumors diagnosed in 2001 and later. Tumors diagnosed prior to 2001 have been converted from ICD-O-2. Effective with cases diagnosed in 2010 and forward, this item also includes codes for new terms as per the 2008 WHO Hematopoietic/Lymphoid publication.

Codes

Considerations for Use

See ICD-O-3, Morphology Section and the SEER Hematopoietic database (http://seer.cancer.gov/tools/heme/).
Section: Cancer Identification Data Items
Behavior Code ICD-O-3

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>1523 BehavICDO3</td>
<td>1</td>
<td>NAACCR Item #523</td>
</tr>
</tbody>
</table>

Description

Code for the behavior of the tumor being reported using ICD-O-3. ICD-O-3 was adopted as the standard coding system for tumors diagnosed in 2001 and later. Tumors diagnosed prior to 2001 have been converted from ICD-O-2.

Juvenile astrocytoma is coded as borderline in ICD-O-3; North American registries report as 9421/3.

Codes

0 Benign
1 Uncertain whether benign or malignant
   Borderline malignancy
   Low malignant potential
   Uncertain malignant potential
2 Carcinoma in situ
   Intraepithelial
   Noninfiltrating
   Noninvasive
3 Malignant, primary site
6 Malignant, metastatic site
   Malignant, secondary site
9 Malignant, uncertain whether primary or metastatic site

Considerations for Use

Section: Cancer Identification Data Items
Behavior Recode for Analysis

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behavior_Recode_For_Analysis</td>
<td>8</td>
<td>Derived based upon NAACCR Items #400, #522, and #523</td>
</tr>
</tbody>
</table>

**Description**

The purpose of this variable is to allow for selection of behavior codes that are consistent between ICD-O-2 and ICD-O-3. ICD-O-3 is used to code cases diagnosed on or after January 1, 2001. Codes that are newly malignant in ICD-O-3 and codes that are no longer malignant in ICD-O-3 (e.g., borderline ovarian cancers) show up as invalid.

**Codes**

See Appendix II for coding.

**Considerations for Use**

Section: Cancer Identification Data Items
Primary Site Recode

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site_Recode_ICD_O_3_WHO_2008</td>
<td>8</td>
<td>Derived based upon NAACCR Items #400 and #522</td>
</tr>
</tbody>
</table>

Description

The values of the primary site recode variable are based on the primary site and histology data fields submitted by the registries. The site recode variables define the major cancer sites that are commonly used in the reporting of cancer incidence data. This recode is defined by the SEER program.

Codes

See Appendix II for coding.

Considerations for Use

Section: Cancer Identification Data Items
Primary Site Recode
with Mesothelioma and Kaposi Sarcoma

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>SiterecwithKaposiandmesothelio</td>
<td>8</td>
<td>Derived based upon NAACCR Items #400 and #522</td>
</tr>
</tbody>
</table>

Description
The values of the primary site recode variable are based on the primary site and histology data fields submitted by the registries. The site recode variables define the major cancer sites that are commonly used in the reporting of cancer incidence data. This recode pulls out Mesothelioma and Kaposi Sarcoma as separate categories and is the recode used by CDC, NCI, and NAACCR in their surveillance publications. This recode is defined by the SEER program.

Codes
See Appendix II for coding.

Considerations for Use
Reference for Primary Site Recode for ICD-O-3 is:
Section: Cancer Identification Data Items
SEER-Modified International Classification of Childhood Cancer (ICCC) Recode

SEER-Modified International Classification of Childhood Cancer (ICCC) Recode

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICCCSiteRecExtendedICDO3WHO200</td>
<td>8</td>
<td>Derived based upon NAACCR Items #400, #522, and #523</td>
</tr>
</tbody>
</table>

Description

The values of the SEER-modified International Classification of Childhood Cancer recode variable are based on the primary site and histology data fields submitted by the registries. The classification of childhood cancer is based on tumor morphology rather than, as for adults, the site of the tumor. These recodes were adapted by the SEER program from groupings developed by the World Health Organization.

Codes

See Appendix II for coding.

Considerations for Use

Note that beginning with data released in 2006, the grouping of childhood cancers is based on ICD-O-3 instead of ICD-O-2.

Reference for the ICCC recodes is:
http://seer.cancer.gov/iccc/
**Section: Stage/Prognostic Factors Data Items**

**SEER Summary Stage 2000**

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>1759 SS2000</td>
<td>1</td>
<td>NAACCR Item #759</td>
</tr>
</tbody>
</table>

**Description**

Code for the summary stage at the initial diagnosis or treatment of the reportable tumor. For site-specific definitions of categories, see SEER *Summary Staging Manual 2000*.

Summary stage should include all information available through completion of surgery (ies) in the first course of treatment or within 4 months of diagnosis in the absence of disease progression, whichever is longer.

**Rationale**

Stage information is important when evaluating the effects of cancer control programs. It is crucial in understanding whether changes over time in incidence rates or outcomes are due to earlier detection of the cancers. In addition, cancer treatment cannot be studied without knowing the stage at diagnosis.

**Codes**

0  *In situ*
1  Localized
2  Regional, direct extension only
3  Regional, regional lymph nodes only
4  Regional, direct extension and regional lymph nodes
5  Regional, NOS
7  Distant
8  Not applicable
9  Unstaged

*Note:* Code 8 was added effective with cases diagnosed in 2004 and forward to be used when there is not an applicable code to reflect stage (e.g., benign brain, borderline ovarian).

*Note:* See also the item Derived SS2000 [3020] for the value of SEER Summary Stage 2000 as generated by the collaborative Staging algorithm.

**Considerations for Use**

Summary stage is a required variable. The correct data item to use (and corresponding code manual) is determined by the year in which the cancer was diagnosed. SEER Summary Stage 2000 is used for tumors diagnosed 2001-2003. NPCR funded central cancer registries also used SEER Summary Stage 2000 for diagnosis year 2016.

See Cautionary Notes – Stage for additional information.
Section: Stage/Prognostic Factors Data Items
SEER Summary Stage 1977

SEER Summary Stage 1977

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I760_SS1977</td>
<td>1</td>
<td>NAACCR Item #760</td>
</tr>
</tbody>
</table>

Description

Code for summary stage at the initial diagnosis or treatment of the reportable tumor. This has traditionally been used by central registries to monitor time trends. For site-specific definitions of categories, see the SEER Summary Staging Guide.

SEER Summary Stage 1977 is limited to information available within 2 months of the date of diagnosis. NAACCR approved extension of this time period to 4 months for prostate tumors diagnosed beginning January 1, 1995.

Rationale

Stage information is important when evaluating the effects of cancer control programs. It is crucial for understanding whether changes over time in incidence rates or outcomes are due to earlier detection of the cancers. In addition, cancer treatment cannot be studied without knowing the stage at diagnosis.

To study historical trends in stage, the coding system must be relatively unchanged (stable) over time. AJCC’s TNM system is updated periodically to maintain clinical relevance with changes in diagnosis and treatment. The surveillance registries often rely on the Summary Stage, which they consider to be more “stable.” Summary Stage has been in widespread use, either as the primary staging scheme or a secondary scheme, in most central and hospital registries since 1977.

Codes

0  In situ
1  Localized
2  Regional, direct extension only
3  Regional, regional lymph nodes only
4  Regional, direct extension and regional lymph nodes
5  Regional, NOS
7  Distant
8  Not applicable
9  Unstaged

Note: Code 8 was added effective with cases diagnosed in 2004 and forward to be used when there is not an applicable code to reflect stage (e.g., benign brain, borderline ovarian).
Considerations for Use

Summary stage is a required variable. The correct data item to use (and corresponding code manual) is determined by the year in which the cancer was diagnosed. Summary Stage 1977 is used for tumors diagnosed between 1998-2000.

See Cautionary Notes – Stage for additional information.

</table>

Description

This data item belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual*, 6th and 7th editions, as well as the SEER Summary Stage, 1977 and 2000. CS Extension identifies primary tumor growth (extension) within the organ of origin or its extension into neighboring organs. For certain sites, such as ovary, discontinuous metastasis is coded in *CS Extension*. Site-specific codes provide extensive detail describing disease extent.

Rationale

Tumor extension at diagnosis is a prognostic indicator used by Collaborative Staging to derive SEER Summary Stage codes.

Codes

3-character code ranging from 000 to 999.

See the most current version of the *Collaborative Stage Data Collection System* ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures.

Considerations for Use

This variable provides detailed information and allows stratification that may not be available when using the stage grouping. Caution should be used to avoid stratification that may introduce biases due to small case counts.

</table>

Description
This data item belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual*, 6th and 7th editions, as well as the SEER Summary Stage, 1977 and 2000. CS Lymph Nodes is site-specific and identifies the regional lymph nodes involved with cancer at the time of diagnosis.

Rationale
The involvement of specific regional lymph nodes is a prognostic indicator used by Collaborative Staging to derive SEER Summary Stage codes.

Codes
3-character code ranging from 000 to 999.

See the most current version of the Collaborative Stage Data Collection System (http://cancerstaging.org) for rules and site-specific codes and coding structures.

Considerations for Use
This variable provides detailed information and allows stratification that may not be available when using the stage grouping. Caution should be used to avoid stratification that may introduce biases due to small case counts.

</table>

Description
This data item belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual, 6th* and *7th* editions, as well as the SEER Summary Stage, 1977 and 2000. CS Lymph Nodes is site-specific and identifies the site(s) of metastatic involvement at the time of diagnosis.

Rationale
The presence of metastatic disease at diagnosis is an independent prognostic indicator used by Collaborative Staging to derive SEER Summary Stage codes.

Codes
2-character code ranging from 00 to 99.

See the most current version of the *Collaborative Stage Data Collection System* ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures.

Considerations for Use
This variable provides detailed information and allows stratification that may not be available when using the stage grouping. Caution should be used to avoid stratification that may introduce biases due to small case counts.

</thead>
<tbody>
<tr>
<td>12880_CSSSF1</td>
<td>3</td>
<td>NAACCR Item #2880</td>
</tr>
</tbody>
</table>

Description
This data item belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual*, 6th and 7th editions, as well as the SEER Summary Stage, 1977 and 2000. CS Site Specific Fact 1 (SSF1) identifies additional information needed to generate stage, or prognostic factors that have an effect on stage or survival.

Rationale
Site-specific factors are used to record additional staging information needed by Collaborative Staging to derive SEER Summary Stage codes for particular site-histology schema.

Codes
3-character code ranging from 000 to 999.

The information recorded in CS Site-Specific Factor 1 differs for each anatomic site. See the most current version of the *Collaborative Stage Data Collection System* ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures.

Considerations for Use
This variable provides detailed information and allows stratification that may not be available when using the stage grouping. Caution should be used to avoid stratification that may introduce biases due to small case counts.

NPCR requires CS SSF1 for the female breast, brain/CNS, lung, pleura, and retinoblastoma primary sites/histologies only. SEER requires CS SSF1 for several primary sites/histologies. Though CS SSF1 may be included in the dataset for other primary sites/histologies, the CS SSF1 information for those primary sites/histologies reported by NPCR central cancer registries was reported as it was available and is considered unreliable at this time.

Description
This data items belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual, 6th* and *7th* editions, as well as the SEER Summary Stage, 1977 and 2000. CS Site Specific Fact 3 (SSF3) identifies additional information needed to generate stage, or prognostic factors that have an effect on stage or survival.

Rationale
Site-specific factors are used to record additional staging information needed by Collaborative Staging to derive SEER Summary Stage codes for particular site-histology schema.

Codes
3-character code ranging from 000 to 999.

The information recorded in CS Site-Specific Factor 3 differs for each anatomic site. See the most current version of the *Collaborative Stage Data Collection System* ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures.

Considerations for Use
This variable provides detailed information and allows stratification that may not be available when using the stage grouping. Caution should be used to avoid stratification that may introduce biases due to small case counts.

NPCR requires CS SSF3 for the prostate primary site/histologies only. SEER requires CS SSF1 for several primary sites/histologies. Though CS SSF1 may be included in the dataset for other primary sites/histologies, the CS SSF1 information for those primary sites/histologies reported by NPCR central cancer registries was reported as it was available and is considered unreliable at this time.

</tr>
</thead>
<tbody>
<tr>
<td>I2879_CSSSF25</td>
<td>3</td>
<td>NAACCR Item #2879; AJCC</td>
</tr>
</tbody>
</table>

Description

This data item belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual*, 6th and 7th editions, as well as the SEER Summary Stage, 1977 and 2000. CS Site Specific Fact 25 (SSF25) identifies additional information needed to generate stage.

Rationale

*CS Site-Specific Factor 25* is used to discriminate between CS staging schema where site and histology alone are insufficient to identify the tumor type or location to identify the applicable staging method.

Codes

3-character code ranging from 000 to 999.

The information recorded in CS Site-Specific Factor 25 differs for each anatomic site. See the most current version of the *Collaborative Stage Data Collection System* ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures).

Considerations for Use

This variable provides detailed information and allows stratification that may not be available when using the stage grouping. Caution should be used to avoid stratification that may introduce biases due to small case counts.

CS SSF25 is required for the following primary sites only: Bile Ducts Distal, Bile Ducts Perihilar, Cystic Duct, Esophagus GE Junction, Lacrimal Gland, Lacrimal Sac, Melanoma Ciliary Body, Melanoma Iris, Nasopharynx, Peritoneum, Peritoneum Female Gen, Pharyngeal Tonsil, Stomach.

<tbody>
<tr>
<td>I2935_CSVerInputOrig</td>
<td>6</td>
<td>NAACCR Item #2935; AJCC</td>
</tr>
</tbody>
</table>

Description
This data items belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the AJCC Cancer Staging Manual, 6th and 7th editions, as well as the SEER Summary Stage, 1977 and 2000. CS Version Input Original indicates the number of the version initially used to code Collaborative Staging (CS) fields. The CS version number is returned as part of the output of the CS algorithm.

Rationale
Over time, the input codes and instructions for CS items may change. This item identifies the correct interpretation of input CS items.

Codes
See the most current version of the Collaborative Stage Data Collection System (http://cancerstaging.org) for rules and site-specific codes and coding structures.

CS Version Input Original is a 6-digit code (e.g., 010100). The first two digits represent the major version number; the second two digits represent minor version changes; and, the last two digits represent even less significant changes, such as corrections of typographical errors that do not affect coding or derivation of results.

This item should not be blank if the CS Derived items contain values. It should be blank if the CS Derived items are empty or the CS algorithm has not been applied.

Considerations for Use
None noted

</table>

**Description**

This data item belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual, 6th* and *7th* editions, as well as the SEER Summary Stage, 1977 and 2000. CS Version Input Derived indicates the used to derive Collaborative Staging (CS) fields and is recorded the first time the CS output fields are derived and are updated each time the CS Derived items are recomputed. The CS version number is returned as part of the output of the CS algorithm.

**Rationale**

The CS algorithm may be re-applied to compute the CS Derived items; for example, when the data are to be used for a special study, transmitted, or when an updated CS algorithm is produced. This item identifies the specific algorithm used to obtain the CS Derived values in the data record.

**Codes**

See the most current version of the Collaborative Stage Data Collection System ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures

CS Version Derived is a 6-digit code (e.g., 010100). The first two digits represent the major version number; the second two digits represent minor version changes; and, the last two digits represent even less significant changes, such as corrections of typographical errors that do not affect coding or derivation results.

This item should not be blank if the CS Derived items contain values. It should be blank if the CS Derived items are empty or the CS algorithm has not been applied.

<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I2937_CSVerInputCur</td>
<td>6</td>
<td>NAACCR Item #2937; AJCC</td>
</tr>
</tbody>
</table>

### Description

This data items belongs to the Collaborative Stage (CS) Data Collection System. The CS is based on the *AJCC Cancer Staging Manual, 6th and 7th editions*, as well as the SEER Summary Stage, 1977 and 2000. CS Input Current identifies the version used to code Collaborative Staging (CS) fields after they have been updated or recoded. This data item is recorded the first time the CS input fields are entered and should be updated each time the CS input fields are modified.

### Rationale

Over time, the input codes and instructions for CS items may change. This item identifies the correct interpretation of input CS items.

### Codes

*See the most current version of the Collaborative Stage Data Collection System ([http://cancerstaging.org](http://cancerstaging.org)) for rules and site-specific codes and coding structures.*

CS Version Input Current is a 6-digit code (e.g., 020100). The first two digits represent the major version number; the second two digits represent minor version changes; and, the last two digits represent even less significant changes, such as corrections of typographical errors that do not affect coding or derivation of results.

This item should not be blank if the CS Derived items contain values. It should be blank if the CS Derived items are empty or the CS algorithm has not been applied.

### Considerations for Use

None noted
**Section: Stage/Prognostic Factors Data Items**

**Derived SEER Summary State 2000**

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I3020_DerivedSS2000</td>
<td>1</td>
<td>NAACCR Item #3020; AJCC</td>
</tr>
</tbody>
</table>

**Description**

This item is the “SEER Summary Stage 2000” derived from the CS algorithm effective with 2004 diagnosis year.

**Rationale**

The Collaborative Stage Data Collection System was designed by a joint task force including representatives from SEER, ACoS, CDC, NAACCR, NCRA, CCCR, CPAC, and AJCC, to provide a single uniform set of codes and rules for coding stage information to meet the needs of all of the participating standard setters. When CS data items are coded, a computer algorithm provides the derivation of SEER Summary Stage 2000.

**Codes**

1-character code ranging from 0 to 9.

See the most current version of the Collaborative Stage Data Collection System ([http://cancerstaging.org/cstage/manuals.html](http://cancerstaging.org/cstage/manuals.html)) for rules and site-specific codes and coding structures.

**Considerations for Use**

Records in this dataset should have a Derived SS2000 value for diagnosis years 2004-2016 for SEER only registries and 2004-2015 for NPCR registries. This data item is usually blank for records in this dataset with a diagnosis year prior to 2004 (1998-2003).

In certain circumstances when information is not available to calculate the Derived Summary Stage 2000, NPCR permits the use of Summary Stage 2000 for diagnosis years ≥2004. Summary Stage 2000 or Derived Summary Stage 2000 could be used for cases diagnosed in 2016. As a result, when stage information is required, it is recommended that consideration be given to using both Derived Summary Stage 2000 and Summary Stage 2000 to account for missing information in Derived Summary Stage 2000. The data item SEER Summary Stage 1977 provides stage information for records with a diagnosis year of 1998-2000 and SEER Summary Stage 2000 provides stage information for records with a diagnosis year of 2001-2003.

To study historical trends in stage, Summary Stage should be selected according to the following table:

<table>
<thead>
<tr>
<th>Diagnosis Years</th>
<th>Summary Stage Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>1998-2000</td>
<td>Summary Stage 1977</td>
</tr>
<tr>
<td>2001-2003</td>
<td>Summary Stage 2000</td>
</tr>
</tbody>
</table>
Previous data quality analyses identified concerns with the information reported in this variable, such as conflicts between the coded CS Extension and Behavior variables; e.g. in situ behavior with an extension indicating an invasive lesion. It is felt that subsequent training and implementation of additional electronic data edits have greatly improved the validity and reliability of the staging information. However, particular attention should be paid to data query results and stage information should be used with caution. If there are concerns about stage distributions resulting from data queries, please contact CDC (uscsdata@cdc.gov).

See Cautionary Notes – Stage for additional information.
Section: Stage/Prognostic Factors Data Items
Merged Summary Stage 2000

Merged Summary Stage 2000

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merged_SumStage2000</td>
<td>1</td>
<td>NPCR, combined from NAACCR Items #759 and #3020</td>
</tr>
</tbody>
</table>

Description
This is a merged stage variable created using three other variables: SEER Summary Stage 1977, SEER Summary Stage 2000, and Derived SS2000.

Codes
See the Appendix II for coding.

Considerations for use
The coding logic for this merged variable is:

- If a case was diagnosed between 1998 and 2000, stage at diagnosis is recorded using the SEER Summary Stage 1977 variable value.
- If a case was diagnosed between 2001 and 2003, stage at diagnosis is recorded using the SEER Summary Stage 2000 variable value.
- If a case was diagnosed between 2004 and 2015 and it was reported to an NPCR registry, then the stage at diagnosis is recorded using the Derived SEER Summary Stage 2000 variable value.
- If a case was diagnosed in 2016 and it was reported to an NPCR registry, then the stage at diagnosis is recorded using the SEER Summary Stage 2000.
- If a case was diagnosed between 2004 and 2016 and it was reported by a SEER registry (Connecticut, Hawaii, Iowa, or New Mexico), then the stage at diagnosis is recorded using the Derived SEER Summary Stage 2000 variable value.
- If the Derived SEER Summary Stage 2000 variable is blank and a valid value is available for the SEER Summary Stage 2000 variable, that value is used to populate the merged variable. For example, if a case was diagnosed in 2013 and Derived SEER Summary Stage 2000 was blank, but SEER Summary Stage 2000 had a value of local, then the merged variable was coded as local stage. Otherwise, the merged variable is left blank for that record.

See Cautionary Notes – Stage for additional information.
Section: Treatment—First Course

RX Summ—Surgery Primary Site

RX Summ—Surgery Primary Site

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I1290_RxSummSurgPrimSite</td>
<td>1</td>
<td>NAACCR Item #1290</td>
</tr>
</tbody>
</table>

Description

Site-specific codes for the type of surgery to the primary site performed as part of the first course of treatment. This includes treatment given at all facilities as part of the first course of treatment.

Codes

- 00 None
- 10-19 Site-specific code; tumor destruction
- 20-80 Site-specific codes; resection
- 90 Surgery, NOS
- 98 Site specific codes; special
- 99 Unknown

Considerations for use

- Data for this variable are available starting with diagnosis year 2003.
- In addition to the site-specific codes, refer to the most recent version of FORDS and SEER Program Code manual for additional instructions:
Section: Treatment—First Course
Merged Radiation

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merged_Radiation</td>
<td>1</td>
<td>Derived from NAACCR Items #1360 and #1570</td>
</tr>
</tbody>
</table>

**Description**
This is a user-defined variable created for this database that merges *RX SUMM–Radiation* (NAACCR item 1360) and *Rad–Regional RX Modality* (NAACCR item 1570) and provides treatment information.

**Codes**
See Appendix II for recoding.

**Considerations for use**
- This variable is only available for **female breast** and for cases submitted by **NPCR central cancer registries**. The data are not available for the following SEER-only states: Connecticut, Hawaii, Iowa, and New Mexico.
- Data for this variable are available starting with **diagnosis year 2003**.
**Section: Over-ride Flags Data Items**

**Over-ride Age/Site/Morph**

**Over-ride Age/Site/Histology Inter-field Review (Inter-field Edit 15)**

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I1990_ORAgeSiteMorph</td>
<td>1</td>
<td>NAACCR Item #1990; SEER</td>
</tr>
</tbody>
</table>

**Description**

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

This over-ride is used with the following edits in the NAACCR Metafile of the EDITS software:

<table>
<thead>
<tr>
<th>Inter-field Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age, Primary Site, Morph ICDO3 (SEER IF15)</td>
<td>Identifies records with an unusual occurrence of a particular age/site/histology combination for a given age group</td>
</tr>
<tr>
<td>Age, Primary Site, Morph ICDO3--Adult (SEER)</td>
<td>Identifies records with an unusual occurrence of a particular age/site/histology combination for a given age group in records with an age at diagnosis ≥15</td>
</tr>
<tr>
<td>Age, Primary Site, Morph ICDO3--Pediatric (NPCR)</td>
<td>Identifies records with an unusual occurrence of a particular age/site/histology combination for a given age group in records with an age at diagnosis 00-14</td>
</tr>
</tbody>
</table>

**Rationale**

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

**Over-ride Flag as Used in the EDITS Software Package**

Some cancers occur almost exclusively in certain age groups.

Edits of the Age, Primary Site, and Morphology require review if a site/morphology combination occurs in an age group for which it is extremely rare. The edit Age, Primary Site, Morph ICDO3-Adult (SEER) edits cases with an Age at Diagnosis of 15 and older. The edit Age, Primary Site, Morph ICDO3--Pediatric (NPCR) edits cases with an Age at Diagnosis of less than 15. The edit Age, Primary Site, Morphology ICDO2 (SEER IF15) contains logic for all ages.

**Instructions for Coding**

1. The data item is to be left blank if the program does not generate an error message (and if the case was not diagnosed in utero) for the edits of the Age, Primary Site, Morphology.
2. Any identified errors should have been corrected for the case if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.

3. Code 1 or 3 indicates that a review of data items in the error or warning message confirmed all were correct.

Codes

1. Reviewed and confirmed that age/site/histology combination is correct as reported
2. Reviewed and confirmed that case was diagnosed in utero
3. Reviewed and confirmed that conditions 1 and 2 both apply
   Blank Not reviewed or reviewed and corrected.

Consideration for Use

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in an age, site, morphology combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.
Section: Over-ride Flags Data Items
Over-ride SeqNo/DxConf

Over-ride Sequence Number/Diagnostic Confirmation Inter-field Review (Inter-field Edit 23)

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I2000_ORSeqNoDxConf</td>
<td>1</td>
<td>NAACCR Item #2000; SEER</td>
</tr>
</tbody>
</table>

Description

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

This over-ride is used with the following edit in the NAACCR Metafile of the EDITS software:

<table>
<thead>
<tr>
<th>Inter-field Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diagnostic Confirm, Seq Num--Central (SEER IF23)</td>
<td>Identifies records with multiple primary cancers where at least one primary cancer is not microscopically confirmed</td>
</tr>
</tbody>
</table>

Rationale

Some edits check for code combinations that are impossible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

Over-ride Flag as Used in the EDITS Software Package

- The edit checks if the case is one of multiple primaries and is not microscopically confirmed or has only positive lab test/marker studies (i.e., Diagnostic Confirmation >5) and tumor sequence number >00 (more than one primary).
- The edit is skipped if the Sequence Number--Central is in the range of 60-99.

Instructions for Coding

1. The data item is left blank if the program does not generate an error message for the Diagnostic Confirmation and Sequence Number Central edit.
2. Any identified errors should have been corrected for the case if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.
3. Code 1 indicates that a review of data items in the error or warning message verified that there are multiple primary cancers of specific sites in which at least one diagnosis was not microscopically confirmed.

Codes

1  Reviewed and confirmed as reported
Consideration for Use

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a diagnostic confirmation and sequence number-central combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.

<td>1</td>
<td>NAACCR Item #2010; SEER</td>
</tr>
</tbody>
</table>

Description

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

Mature central cancer registries can have up to 15-20% multiple primary data. In order to validate coded values across multiple tumor records for a single patient, inter-record edits must be applied to the data. Inter-record edits compare data recorded across more than one record, and are commonly applied across tumor records for a patient that has multiple tumors. These edits compare codes or groups of codes recorded in the same data item(s) between each of the tumor records for the patient. For example, one inter-record edit compares the sequence numbers of multiple tumors for the same patient with their dates of diagnosis to ensure that the sequence numbers have been assigned in the correct chronological order based on diagnosis date.

This over-ride is used with the following Inter-record Edit from the SEER Program:

<table>
<thead>
<tr>
<th>Inter-record Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify Same Primary Not Reported Twice for a Person (SEER IR09)</td>
<td>Identifies records with multiple primary cancers where the date of diagnosis and primary cancer site are within a specified range but the sequence number-central is different</td>
</tr>
</tbody>
</table>

Rationale

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

Over-ride Flag as Used in the EDITS Software Package

Verify Same Primary Not Reported Twice for a Person (SEER IR09) applies to paired organs and does not allow two cases with the same primary site group, laterality and three digit histology code. This edit verifies that the same primary is not reported twice for a person.

Instructions for Coding

1. The data item is left blank if the program does not generate an error message for the edit Verify Same Primary Not Reported Twice for a Person (SEER IR09).
2. Any identified errors should have been corrected if the records are determined to be the same primary cancer. The data item should be blank for records where identified errors were corrected.

3. Code 1 indicates that the case was reviewed and verified that the patient had multiple primaries of the same histology (3 digit) in the same primary site group.

**Codes**

1  Reviewed and confirmed as reported  
Blank  Not reviewed or reviewed and corrected

**Consideration for Use**

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submission. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a primary site, histology, laterality, and sequence number-central combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.

</thead>
<tbody>
<tr>
<td>I2030_ORSiteType</td>
<td>1</td>
<td>NAACCR Item #2030; SEER</td>
</tr>
</tbody>
</table>

#### Description

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

This over-ride is used with the following edits in the NAACCR Metafile of the EDITS software:

<table>
<thead>
<tr>
<th>Inter-field Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Site, Morphology-Type, Behavior ICDO3 (SEER IF25)</td>
<td>Identifies records where the site/histology/behavior combination is not in the SEER Site/Histology Validation List</td>
</tr>
</tbody>
</table>

#### Rationale

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

#### Over-ride Flag as Used in the EDITS Software Package

This edit checks for “usual” combinations of site and ICD-O-3 histology.

1. The Site/Histology validation list (available on the SEER web site, [http://seer.cancer.gov/icd-o-3/](http://seer.cancer.gov/icd-o-3/)) contains those histologies commonly found in the specified primary site. Histologies that occur only rarely or never are not included. These edits require review of all combinations not listed.
2. Since basal and squamous cell carcinomas of non-genital skin sites are not reportable to NPCR, these site/histology combinations do not appear on the SEER validation list.

Review of these cases requires investigating whether a) the combination is biologically implausible, or b) there are cancer registry coding conventions that would dictate different codes for the diagnosis. Review of these rare combinations often results in changes to the primary site and/or morphology, rather than a decision that the combination is correct.

#### Instructions for Coding

1. The data item is left blank if the program does not generate an error message for the edit Primary Site, Morphology-Type, Behavior ICDO3 (SEER IF25).
2. Any identified errors should have been corrected if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.
3. Code 1 indicates that the case was reviewed and both the site and histology are correct.

Codes

1  Reviewed and confirmed as reported
Blank  Not reviewed or reviewed and corrected

Consideration for Use

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a primary site, histology, and behavior combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.

<tbody>
<tr>
<td>Diagnostic Confirmation, Behavior ICDO3 (SEER IF31)</td>
<td>Identifies records with a behavior of in situ and a non-microscopic diagnostic confirmation</td>
</tr>
<tr>
<td>Morphology--Type/Behavior ICDO3 (SEER MORPH)</td>
<td></td>
</tr>
</tbody>
</table>

Rationale

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

Over-ride Flags as Used in the EDITS Software Package

The edit Diagnostic Confirmation, Behavior checks that, for *in situ* cases (Behavior = 2), Diagnostic Confirmation specifies microscopic confirmation (1, 2, or 4).

The distinction between *in situ* and invasive is very important to a registry, since prognosis is so different. Since the determination that a neoplasm has not invaded surrounding tissues, i.e., *in situ*, is made microscopically, cases coded *in situ* in behavior should have a microscopic confirmation code. However, very rarely, a physician will designate a case noninvasive or *in situ* without microscopic evidence.

The edit Morphology--Type/Behavior performs the following check:

1. Codes listed in ICD-O-3 with behavior codes of only 0 or 1 are considered valid, since the behavior matrix allows for the elevation of the behavior of such histologies when the tumor is *in situ* or malignant. This edit forces review of these rare cases to verify that they are indeed *in situ* or malignant.
2. The following ICD-O-3 histologies are generally not accepted as *in situ*: 8000-8005, 8020, 8021, 8331, 8332, 8800-9055, 9062, 9082, 9083, 9110-9493, 9501-9989. This edit forces review of these cases.
3. If a Morphology-Type/Behavior edit produces an error or warning message and the case is one in which the 4-digit morphology code is one that appears in ICD-O-3 only with behavior codes of 0 or 1, or the case is one in which the 4-digit morphology code is not generally accepted with a behavior code of 2, this edit forces review to verify the coding of morphology and that the behavior should be coded malignant or in situ.

Exceptions:
If year of Date of Diagnosis > 2000, then a behavior code of 1 is valid for the following ICD-O-3 histologies are valid with a behavior code of 1: 8442, 8451, 8462, 8472, and 8473.

If year of Date of Diagnosis > 2003, the following ICD-O-3 benign histologies will pass without review: 8146, 8271, 8861, 8897, 9121, 9122, 9131, 9161, 9350, 9351, 9352, 9360, 9361, 9383, 9384, 9394, 9412, 9413, 9444, 9492, 9493, 9506, 9531, 9532, 9533, 9534, 9537, 9541, 9550, 9562, and 9570.

4. Grades 5-8 with histologies not in the range of 9590-9948 are impossible.

5. Some terms in ICD-O-3 carry an implied statement of grade. These histologies must be reported with the correct grade as stated below. An error of this type cannot be over-ridden.

**ICD-O-3**

- 8020/34 Carcinoma, undifferentiated
- 8021/34 Carcinoma, anaplastic
- 8331/31 Follicular adenocarcinoma, well differentiated
- 9082/34 Malignant teratoma, undifferentiated
- 9083/32 Malignant teratoma, intermediate type
- 9401/34 Astrocytoma, anaplastic
- 9451/34 Oligodendroglioma, anaplastic
- 9511/31 Retinoblastoma, differentiated
- 9512/34 Retinoblastoma, undifferentiated

**Instructions for Coding**

1. Tee data item is left blank if the program does not generate an error message for the edit Diagnostic Confirmation, Behavior ICDO3 (SEER IF31) or Morphology--Type/Behavior ICDO3 (SEER MORPH).

2. Any identified errors should have been corrected if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.

3. Code 1, 2, or 3 indicates that the case was reviewed and confirms that the data are correct.

**Codes**

1. Reviewed and confirmed that the pathologist states the primary to be “in situ” or “malignant” although the behavior code of the histology is designated as “benign” or “uncertain” in ICD-O-2 or ICD-O-3
2 Reviewed and confirmed that the behavior code is “in situ,” but the case is not microscopically confirmed

3 Reviewed and confirmed that conditions 1 and 2 both apply

Blank Not reviewed or reviewed and corrected

Consideration for Use

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a diagnostic confirmation, histology, and behavior combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.

<td>Type of Rep Srce(DC),Seq Num--Cent, ICDO3 (SEER IF04)</td>
<td>Identifies records with multiple primary cancers where one is reported only through a death certificate and histology code is &lt;9590</td>
</tr>
</tbody>
</table>

Rationale

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

Over-ride Flag as Used in the EDITS Software Package

The edit Type of Rep Srce(DC), Seq Num—Cent checks that if the case is a death-certificate-only case and the histology is not a lymphoma, leukemia, immunoproliferative, or myeloproliferative disease (ICD-O-3 histology is less than 9590), then the tumor sequence number must specify one primary only (sequence ‘00’).

Instructions for Coding

1. The data item is left blank if the program does not generate an error message for the reporting source edit.
2. Any identified errors should have been corrected if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.
3. Code 1 indicates that the case was reviewed, confirms that the type of reporting source, histologic type, and tumor sequence number data are correct, verifies that a second or subsequent primary with a reporting source of death-certificate-only has been reviewed and is indeed an independent primary.
Codes

1  Reviewed and confirmed as reported
Blank  Not reviewed or reviewed and corrected

Consideration for Use

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a type of reporting source, histologic type, and tumor sequence number combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.

Description

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

This over-ride is used with the following edits in the NAACCR Metafile of the EDITS software:

<table>
<thead>
<tr>
<th>Inter-field Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seq Num--Central, Prim Site, Morph ICDO3 (SEER IF22)</td>
<td>Identifies records with multiple primary cancers where one is reported as an ill-defined primary site</td>
</tr>
</tbody>
</table>

Rationale

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

Over-ride Flag as Used in the EDITS Software Package

The edit forces review of multiple primary cancers when one of the primaries is coded to a site/morphology combination that could indicate a metastatic site rather than a primary site.

1. If Sequence Number-Central indicates the person has had more than one primary, then any case with one of the following site/histology combinations requires review:
   - C760-C768 (ill-defined sites) or C809 (unknown primary) and ICD-O-3 histology < 9590.
   - C770-C779 (lymph nodes) and ICD-O-3 histology not in the range 9590-9729; or C420-C424 and ICD-O-3 histology not in the range 9590-9989. That combination is most likely a metastatic lesion.
   - Any site ICD-O-3 histology in the range 9740-9758.

2. If it turns out that the suspect tumor is a manifestation of one of the patient’s other cancers, the metastatic or secondary case is deleted, remaining cases are re-sequence, and the coding on the original case is corrected as necessary.

Instructions for Coding

1. The data item is left blank if the program does not generate an error message for the ill-defined primary site edit.
2. Any identified errors should have been corrected if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.

3. Code 1 indicates that the case was reviewed and confirms that a second or subsequent primary report with an ill-defined primary site is indeed an independent primary.

**Codes**

1  Reviewed and confirmed as reported: a second or subsequent primary reported with an ill-defined primary site (C76.0-C76.8, C80.9) has been reviewed and is an independent primary

   Blank  Not reviewed or reviewed and corrected

**Consideration for Use**

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a primary site, histologic type, and tumor sequence number combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.

**Description**

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

This over-ride is used with the following edits in the NAACCR Metafile of the EDITS software:

<table>
<thead>
<tr>
<th>Inter-field Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Site, Behavior Code ICDO3 (SEER IF39)</td>
<td>Identifies records with a non-specific primary cancer site code with an <em>in situ</em> behavior</td>
</tr>
</tbody>
</table>

**Rationale**

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See NAACCR Standards for Cancer Registries Volume II: Data Standards and Data Dictionary Chapter IV Recommended Data Edits and Software Coordination of Standards.

**Over-ride Flag as Used in the EDITS Software Package**

The edit, Primary Site, Behavior Code, requires review of the following primary sites with a behavior of *in situ* (ICD-O-2 or ICD-O-3 behavior = 2):

- C269 Gastrointestinal tract, NOS
- C399 Ill-defined sites within respiratory system
- C559 Uterus, NOS
- C579 Female genital tract, NOS
- C639 Male genital organs, NOS
- C689 Urinary system, NOS
- C729 Nervous system, NOS
- C759 Endocrine gland, NOS
- C760-C768 Ill-defined sites
- C809 Unknown primary site

Since the designation of *in situ* is very specific and almost always requires microscopic confirmation, ordinarily specific information should also be available regarding the primary site. Conversely, if inadequate information is available to determine a specific primary site, it is unlikely that information about a cancer being *in situ* is reliable.
If an in situ diagnosis is stated, more specific primary site information should be sought. A primary site within an organ system can sometimes be identified based on the diagnostic procedure or treatment given or on the histologic type. When no more specific site can be determined, a behavior code of 3 is usually assigned. In the exceedingly rare situation in which it is certain that the behavior is in situ and no more specific site code is applicable, Over-ride Site/Behavior is set to 1.

**Instructions for Coding**

1. The data item is left blank if the program does not generate an error message for the Primary Site, Behavior Code ICDO3 (SEER IF39) edit.
2. Any identified errors should have been corrected if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.
3. Code 1 indicates that the case was reviewed and confirms that the in situ behavior and nonspecific site are correctly coded and that no further information about the primary site is available.

**Codes**

1  Reviewed and confirmed as reported  
Blank  Not reviewed or reviewed and corrected

**Consideration for Use**

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a primary site and behavior combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.
### Section: Over-ride Flags Data Items  
#### Over-ride Site/Lat/Morph

<table>
<thead>
<tr>
<th>SAS Alternate Name</th>
<th>Length</th>
<th>Source of Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>I2074_ORSiteLatMorph</td>
<td>1</td>
<td>NAACCR Item #2074; SEER</td>
</tr>
</tbody>
</table>

**Description**

Some computer edits identify errors. Others indicate possible errors that require manual review for resolution. To eliminate the need to review the same cases repeatedly, over-ride flags have been developed to indicate that data in a record (or records) have been reviewed and, while unusual, are correct.

This over-ride is used with the following edits in the NAACCR Metafile of the EDITS software:

<table>
<thead>
<tr>
<th>Inter-field Edit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Laterality, Primary Site, Morph ICDO3 (SEER IF42)</td>
<td>Identifies records with a paired organ as the primary cancer site code with an in situ behavior and laterality is not coded to 1, 2, or 3.</td>
</tr>
</tbody>
</table>

**Rationale**

Some edits check for code combinations that are possible, but quite rare. If the code combination generates an error message and review of the case indicates that the codes are correct for the case, then the over-ride flag is used to skip the edit in the future. See Chapter IV, Recommended Data Edits and Software Coordination of Standards.

**Over-ride Flag as Used in the EDITS Software Package**

The edit Laterality, Primary Site, Morph requires that if the Primary Site is a paired organ and ICD-O-3 behavior is *in situ* (2), then laterality must be 1, 2, or 3.

The intent of this edit is to force review of *in situ* cases for which laterality is coded 4 (bilateral) or 9 (unknown laterality) as to origin. In rare instances when the tumor is truly midline (9) or the rare combination is otherwise confirmed correct, code 1 is entered for Override Site/Lat/Morph.

**Instructions for Coding**

- The data item is left blank if the program does not generate an error message for the ity, Primary site, Morph ICDO3 (SEER IF42) edit.
- Any identified errors should have been corrected if an item is discovered to be incorrect. The data item should be blank for records where identified errors were corrected.
- Code 1 indicates that the case was reviewed and confirms that the *in situ* behavior and laterality are correctly coded.

**Codes**

1  Reviewed and confirmed as reported  
Blank  Not reviewed or reviewed and corrected
Consideration for Use

Previous evaluations have shown that over-ride flags may be coded when not needed. These may result when edits are applied by individual state cancer registries that are more stringent than required for the CDC and SEER data submissions. Other instances may result from coding all over-ride flags for an individual record. If a data query results in a primary site and behavior combination that is unexpected, it is recommended that this data item be reviewed in conjunction with those records.
