

GET THE FACTS:

Sources of Sodium in Your Diet

All across the United States, high sodium intake is a major problem. On average, American adults eat more than 3,400 milligrams (mg) of sodium each day, which is significantly higher than the recommended limit. The *2015–2020 Dietary Guidelines for Americans* recommend that Americans consume less than 2,300 mg of sodium each day as part of a healthy eating pattern.

The vast majority of U.S. adults eat more sodium than they need. Having accurate information about where dietary salt comes from can help Americans stick to the recommendations.

The Salt Shaker Is Not to Blame

- About 90% of the sodium Americans eat comes from restaurant, prepackaged, and processed foods.
- Only about 5% to 6% of dietary sodium is added at the table.

Surprising Sources of Sodium

- Lots of packaged and processed foods can have high levels of sodium, and they may not even taste salty to many consumers.
- Breads and rolls, pizza, and sandwiches are top contributors of sodium in the American diet.
- For example, one slice of bread can contain anywhere from 80 to 230 mg of sodium.
- Lunch meats are a major source—1 serving, around 6 thin slices, typically can contain 750 mg or more of sodium.

Food	Sodium Range (in milligrams)
1 slice white bread	80 - 230
3 oz turkey breast, deli or pre-packaged luncheon meat	450 - 1,050
4 oz slice frozen pizza, plain cheese, regular crust	370 - 730
4 oz slice restaurant pizza, plain cheese, regular crust	510 - 760
4 oz boneless, skinless chicken breast, fresh	40 - 330
3 oz chicken strips, restaurant, breaded	430 - 900
3 oz chicken nuggets, frozen, breaded	200 - 570
1 cup chicken noodle soup, canned prepared	100 - 940
1 corn dog, regular	350 - 620
1 cheeseburger, fast food restaurant	710 - 1,690
1 oz slice American cheese, processed (packaged or deli)	330 - 460
1 cup canned pasta with meat sauce	530 - 980
5 oz pork with barbecue sauce (packaged)	600 - 1,120
1 oz potato chips, plain	50 - 200

Sodium levels of the same food can vary widely, so choose wisely.

Sources of Sodium in Your Diet

Keeping an Eye on Labels as You Shop Is Important

- Frozen pizza typically contains between 370 and 730 mg of sodium in just 1 slice.
- Soup can also be high in sodium. For example, tomato soup can range from 700 to 1,260 mg of sodium in 8 ounces (1 cup).
- Many seemingly healthy foods, such as canned vegetables, often contain added sodium.
- Raw chicken and other meats can have sodium and flavor solutions added.
- Even foods labeled as “less sodium” or “reduced sodium” can contain significant amounts. One tablespoon of “less sodium” soy sauce typically contains more than 500 mg, and consumers often eat more than 1 serving at a time.

Why Cut Back? And How?

Eating too much sodium can lead to increased blood pressure, which can raise your risk for heart attack, stroke, and other cardiovascular conditions. Reducing sodium

intake can help lower these risks. To help protect your heart, make a commitment to:

- **Try to eat more fruits and vegetables.** For canned and frozen vegetables, look for no salt added or low sodium versions, or choose frozen varieties without sauce.
- **Check nutrition labels on packaged foods.** Compare sodium in different brands for products like processed soups, dressings/sauces, breads, and frozen meals, and choose those with lower sodium.
- **Eat at home more frequently, and prepare more meals from scratch.** To boost flavor, use salt free herbs and spices rather than processed sauces, packaged broths, or condiments.
- **Ask restaurants not to add salt to your meal,** and use condiments in small amounts. Also ask your favorite restaurants, stores, and food manufacturers to offer more low-sodium options.
- **Re-train your taste buds.** Over time, the less sodium you eat, the less you'll want.
