HOW CAN I GET AHEAD OF SEPSIS?

1. Talk to your doctor or nurse about steps you can take to prevent infections. Some steps include taking good care of chronic conditions and getting recommended vaccines.

2. Practice good hygiene, such as handwashing, and keeping cuts clean until healed.

3. Know the symptoms of sepsis.

4. ACT FAST. Get medical care IMMEDIATELY if you suspect sepsis or have an infection that’s not getting better or is getting worse.

Always remember, sepsis is a medical emergency. Time matters. If you or your loved one suspects sepsis or has an infection that’s not getting better or is getting worse, ask your doctor or nurse, “Could this infection be leading to sepsis?”

This project has been funded in whole or in part with Federal funds from the National Center for Emerging Zoonotic and Infectious Diseases (NCEZID), Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (HHS), under Contract No. 200-2016-F-90343.

IT’S TIME TO TALK ABOUT SEPSIS.

Infections put you and your family at risk for a life-threatening condition called sepsis.
WHAT ARE THE SYMPTOMS?

There is no single symptom of sepsis. Symptoms of sepsis can include a combination of any of the following:

- Confusion or disorientation
- Shortness of breath
- High heart rate
- Fever, or shivering, or feeling very cold
- Extreme pain or discomfort
- Clammy or sweaty skin

More than 1.5 million people get sepsis each year in the U.S.
At least 250,000 Americans die from sepsis each year.

WHAT IS SEPSIS?

Sepsis is the body’s extreme response to an infection. It is life-threatening, and without timely treatment, sepsis can rapidly cause tissue damage, organ failure, and death.

Sepsis happens when an infection you already have—in your skin, lungs, urinary tract or somewhere else—triggers a chain reaction throughout your body.

WHAT CAUSES SEPSIS?

When germs get into a person’s body, they can cause an infection. If that infection isn’t stopped, it can cause sepsis.

WHO IS AT RISK?

Anyone can get an infection, and almost any infection can lead to sepsis. Certain people are at higher risk:

- Adults 65 or older
- People with chronic conditions, such as diabetes, lung disease, cancer and kidney disease
- People with weakened immune systems
- Children younger than one

The most frequently identified germs that cause infections that can develop into sepsis include Staphylococcus aureus (staph), Escherichia coli (E. coli), and some types of Streptococcus (strep).
