FOR HEALTHCARE PROFESSIONALS IN LONG-TERM CARE

BE VIGILANT. PROTECT YOUR RESIDENTS FROM SEPSIS.

More than **1.5 million** people get sepsis each year in the U.S.

**At least 250,000** Americans die from sepsis each year.

Sepsis is a medical emergency. Protect your residents by acting fast. Delayed recognition and treatment of sepsis increases your residents’ risk of death.

**SPOT THE SIGNS**
Sepsis is the body’s extreme response to an infection. It is life-threatening, and without prompt treatment, often rapidly leads to tissue damage, organ failure, and death. It happens when an infection your resident already has—like in their skin, lungs, or urinary tract—triggers a chain reaction throughout their body.

**KNOW THE RISKS**
Anyone can get an infection, and almost any infection can lead to sepsis. Adults 65 or older are at an increased risk of developing infections that can lead to sepsis. Sepsis also more commonly occurs in:
- People with chronic medical conditions, such as diabetes, lung disease, cancer, and kidney disease
- People with weakened immune systems
- Children younger than one

The most frequently identified pathogens that cause infections that can develop into sepsis include *Staphylococcus aureus* (staph), *Escherichia coli* (E. coli), and some types of *Streptococcus* (strep).

**PREVENT INFECTIONS AND ACT FAST**
You play a critical role. Remember to:
- **Act fast if you suspect sepsis**, or if your residents’ infections are not getting better or are getting worse. There is no single symptom of sepsis. Signs of sepsis can include a combination of any of the following:
  - Confusion or disorientation
  - Shortness of breath
  - High heart rate
  - Fever, or shivering, or feeling very cold
  - Extreme pain or discomfort
  - Clammy or sweaty skin

- Prevent infections by following infection control practices (e.g., hand hygiene, catheter removal) and ensuring residents receive recommended vaccines.
- Ensure residents’ scrapes and wounds are kept clean until healed.
