PROTECT YOUR PATIENTS FROM SEPSIS.

Infections put your patients at risk for sepsis. Be alert to the signs and, if suspected, act fast.

Sepsis is the body’s extreme response to an infection. It is life-threatening, and without prompt treatment, often rapidly leads to tissue damage, organ failure, and death.

SEPSIS STATS

More than 1.5 MILLION people get sepsis each year in the U.S.

At least 250,000 Americans die from sepsis each year.

About 1 IN 3 PATIENTS who die in a hospital have sepsis.

WHAT CAUSES SEPSIS?

The most frequently identified pathogens that cause infections that can develop into sepsis include *Staphylococcus aureus* (staph), *Escherichia coli* (E. coli), and some types of *Streptococcus* (strep).

Four types of infections that are often linked with sepsis:

- Lungs (e.g., pneumonia)
- Urinary tract (e.g., kidney)
- Skin
- Gut

Anyone can get an infection, and almost any infection can lead to sepsis. Certain patients are at increased risk for developing sepsis:

65+

Adults 65 or older

People with chronic medical conditions, such as diabetes, lung disease, cancer, and kidney disease

People with weakened immune systems

Children younger than one

WHO IS AT RISK?

GET AHEAD OF SEPSIS

KNOW THE RISKS. SPOT THE SIGNS. ACT FAST.
There is no single symptom of sepsis. Signs of sepsis can include a combination of any of the following:

- Confusion or disorientation
- Shortness of breath
- High heart rate
- Fever, or shivering, or feeling very cold
- Extreme pain or discomfort
- Clammy or sweaty skin

Sepsis is a medical emergency. Protect your patients by acting fast. Delayed recognition and treatment of sepsis increases your patients’ risk of death.

**HOW CAN I GET AHEAD OF SEPSIS?**

Healthcare professionals can:

- **Know sepsis signs** to identify and treat patients early.
- **Act fast** if you suspect sepsis.
- **Prevent infections** by following infection control practices (e.g., hand hygiene, catheter removal) and ensuring patients receive recommended vaccines.
- **Educate your patients and their families about:**
  - Preventing infections.
  - Keeping scrapes and wounds clean.
  - Managing chronic conditions.
  - Recognizing early signs of worsening infection and sepsis and seeking immediate care if signs are present.

**WHAT SHOULD I DO IF I SUSPECT SEPSIS?**

- **Immediately alert clinician in charge if it is not you.**
- **Know your facility’s existing guidance for diagnosing and managing sepsis.**
- **Start antibiotics as soon as possible, in addition to other therapies appropriate for that individual patient.**
- **Check patient progress frequently.** Reassess antibiotic therapy 24–48 hours to stop or change therapy as needed. Be sure antibiotic type, dose, and duration are correct.
