

Antibiotic-Resistant Gonorrhea

Gonorrhea is developing resistance to the antibiotics we use to treat it.

There are about **820,000** new gonorrhea infections each year in the U.S.

Gonorrhea is the **2nd** most commonly reported infectious disease

We are down to **1** recommended effective class of antibiotics to treat it

The public health and medical communities must work together to:

Monitor antibiotic resistance

Develop new treatment options

With only one recommended treatment option remaining, **it's time to take action.**
