SCREENING AND TESTING MEN WHO HAVE SEX WITH MEN (MSM) FOR SYPHILIS

DEPARTMENT OF HEALTH AND HUMAN SERVICES
CENTERS FOR DISEASE CONTROL AND PREVENTION

A GUIDE FOR HEALTH CARE PROFESSIONALS
**INTRODUCTION**

Primary and secondary (P&S) syphilis rates in the United States declined by 89.7 percent during 1990-2000. However, according to data from the Centers for Disease Control and Prevention, the rate of P&S syphilis increased steadily after 2001. Overall increases in rates during 2001-2004 were observed only among men. The rate of P&S syphilis among men increased 11.9 percent between 2003 and 2004.

CDC figures show that nearly all counties with a high incidence of syphilis cases (more than 10 cases/100,000 people) are in the South or in large metropolitan areas with sizable men who have sex with men (MSM) populations.

The Syphilis Elimination Effort (SEE) is a national initiative bringing health care providers and community leadership together to mobilize communities to drive down syphilis rates in the United States. SEE is a part of the Centers for Disease Control and Prevention’s (CDC) National Plan to Eliminate Syphilis from the United States. For more information on the plan, go to www.cdc.gov/std/see/.

To help fight syphilis, SEE needs the support of health care providers, members of community-based organizations (CBOs), religious leaders, policy makers, and activists in order to:

- Increase detection and monitoring of syphilis cases;
- Strengthen community involvement and partnerships to implement locally relevant syphilis elimination action plans;
- Respond rapidly to outbreaks to interrupt transmission of the disease.
enhance health promotion efforts to promote preventive sexual and
health care behaviors to those at risk;

and expand clinical and laboratory services to promote access to and use
of high-quality care for people infected with or exposed to syphilis.

Syphilis outbreaks among gay and bisexual men in cities including Los Angeles,
Seattle, San Francisco, New York City, Chicago, and Miami Beach have been
classified by high rates of HIV co-infection. Syphilis increases the risk of
getting and transmitting HIV two- to five-fold.

Medical practices primarily serving MSM — and general practices with some
MSM among their patients — need to address syphilis and its co-factor role in
HIV transmission. Your practice is a logical venue to routinely screen for syphilis,
HIV, and other sexually transmitted diseases (STDs), that affect the population
in general, not just MSM. However, in addition to syphilis and HIV, MSM are
at high risk for other STDS including, chlamydia, gonorrhea, and hepatitis A and
B. When counseling patients about the need for regular testing for STDs, it is
important that they know that condom use while offering some prevention,
is not 100 percent effective against syphilis.

Current clinical services for MSM do not always include integrated services
to prevent all STDs affecting this population. This booklet offers suggestions
to help build trust and rapport with MSM so they will be forthcoming about
their sexual history and behaviors. It also suggests possible approaches for
encouraging them to be tested annually for syphilis, HIV, and other STDs.

A CDC publication, “Sexually Transmitted Diseases Treatment Guidelines - 2006”
recommends comprehensive STD prevention, screening, testing, treatment,
and clinical management services for sexually active MSM, including annual
tests for HIV, syphilis, gonorrhea, and chlamydia, and vaccination against
hepatitis A and B. Please visit www.cdc.gov/std/treatment to obtain
Sexually Transmitted Diseases Treatment Guidelines - 2002. Feel free to download these treatment guidelines from this Web site to your Palm device.

SEE offers the following additional materials to assist you in diagnosing and treating syphilis and other STDs:
- Sexual History Discussion Form,
- A Guide to Taking a Sexual History,
- Syphilis - Physician's Pocket Guide, and
- The STD Treatment Guidelines Pocket Guide

### QUICK FACTS ABOUT SYPHILIS
Syphilis is a systemic STD caused by the Treponema pallidum bacterium, transmitted person to person via vaginal, anal, or oral sex through direct contact with a syphilis chancre. Rarely, it may be transmitted during foreplay, and it can also be transmitted to the fetus during pregnancy. It can be cured with penicillin or a substitute drug when the patient is allergic to penicillin.

### PREPARE YOUR PRACTICE
"It’s hard for me to talk about [syphilis]... because you feel embarrassed that you will be judged." An MSM in Los Angeles.

Although not all MSM have the same communication concerns regarding health care providers, some key issues emerge. Research studies found that gay men may fear that they will receive poor treatment, be denied care, or be judged or made to feel unwelcome if they admit their homosexuality. Many gay men, therefore, are not forthcoming about their sexual history. A Guide to Taking a Sexual History outlines questions designed to put patients at ease and elicit honest responses about their sexual practices.

As a health care provider, you represent the first line of defense for syphilis elimination. Your involvement with the SEE community mobilization effort is crucial. You are often the only health information source for those at risk or in need of treatment for syphilis. Patients see you as a credible expert on what
It is important to the community in terms of medicine and diseases.

"First you greet the person, 'how was your day?' Then start talking about when was the last time you had sex, who are you having sex with and so on." An MSM in New York City

If your practice primarily serves MSM, you are undoubtedly aware of health-related issues of particular concern to your patients, and have created a welcoming practice environment. In treating patients’ overall health, you may already be incorporating messages about the importance of regular testing for syphilis and other STDs as well as HIV. If you are not currently emphasizing the importance of testing for syphilis, please join SEE’s effort and start testing and counseling for syphilis. Reporting the presumptive and confirmed cases of syphilis to your health department within one working day of the diagnosis is also very important.

**Syphilis Increases the Risk of Contracting HIV Two to Five Times.**

**Physician Communication to Achieve**

  - If multiple
    - "The MD had, th could atracted other s them to"
If your practice does not primarily serve MSM, a few simple, low-key signals can help communicate that your office offers equal treatment regardless of sexual orientation. Such signals can empower patients to be candid about their sexuality. Although a patient’s sexual orientation is only one factor to be considered in an overall approach to health, it is an important aspect as it relates to possible health risks.

Consider the following steps:

- In addition to other information and reading materials you provide for your patients, perhaps you could include posters and pamphlets with gay-friendly messages and a few gay-health oriented magazines in your reception or waiting area – if appropriate.
- Or think about setting up one gay-friendly examining room in your practice with gay-health oriented publications and posters.
- Train administrative, nursing, and clinical staff on how to contribute to a welcoming practice environment.
- Ensure that patients’ initial visit forms use appropriate language. For example, use “relationship status” and offer gender-neutral options to make it easier for the patient to provide truthful information.

**WHY NOT BE SURE YOU DON’T HAVE SYPHILIS? LET’S TEST YOU TODAY.**
Remember: As a health care provider, you are in a unique position to provide increased syphilis screening, testing, treatment, and reporting. If you help improve syphilis testing, treatment, and reporting, it will be possible to more accurately assess the rates of syphilis in the community, and to provide treatment for more people affected and living with syphilis. Participating in SEE may be a chance to claim your part in eliminating a disease in your community!

---

**PREPARE YOURSELF**

Comfort level plays an important role in discussing sensitive matters both for the patient and for the physician.

“If I didn’t feel comfortable with my doctor, what benefit do I get in going to my doctor? I have to tell my doctor everything, so that he can give me the treatment I need. But if I go and tell him lies, or I don’t tell him what’s happening to me, he can’t help me.” An MSM in Los Angeles

Whether you primarily treat MSM or only a few MSM, the SEE materials and CDC guidelines offer a quick checklist for diagnosis and treatment of syphilis and other STDs, and they may help you feel confident when providing these services. Awareness of issues to be discussed and potential problems to be addressed ensures that you offer your patients excellent overall health care.

“Clinicians providing health care to gay and bisexual men may not be aware of all the things that should be discussed during the visit.” A New York City physician who primarily sees gay and lesbian patients.

Screening for syphilis and other STDs is a critical component of early detection and treatment. MSM should be routinely screened for syphilis, especially in light of the fact that syphilis infection increases the risk of contracting HIV.
A physician recently commented, “We’ve seen cases where someone has been seen by his [doctor] two or three times before the [doctor] realized [the patient had syphilis], thinking early syphilis rashes were a reaction to HIV antiviral medication.”

Syphilis is often called “the great imitator” because its symptoms mimic those of many other diseases. Enlarged lymph glands, headaches, skin rashes, fever, sore throat, and swelling in joints can indicate syphilis and numerous other conditions such as flu, bronchitis, measles, dermatitis or arthritis, to name a few. Late-stage syphilis presents symptoms such as paralysis, numbness, difficulty coordinating muscle movements, fatigue, and dementia that may be mistaken for markers of such conditions as Alzheimer’s, cardiovascular disease, or neurological damage.

Syphilis may go undiagnosed and untreated for several reasons.

In the primary stage, patients may not notice syphilis chancres, especially in the mouth or rectum. In the secondary stage, rashes associated with syphilis may be faint and go unnoticed by the patient.

With symptoms being difficult to pinpoint, patients may not be aware that they are infected. Therefore, a thorough physical examination that includes the patient’s sexual history is very important for diagnosing syphilis. Syphilis—Physician’s Pocket Guide offers a quick checklist of symptoms and available treatment options.
"Many doctors don’t ask about sexual activity." An MSM in Los Angeles

In order to offer comprehensive health information and services to MSM clients, make sure that you and your staff are up-to-date on important issues relevant to MSM such as depression, substance abuse, partner violence, HIV and STDs, discrimination, anal papiloma, prostate/recticular/cancer, and hepatitis immunization. Although raising sexual safety issues and encouraging periodic tests for HIV and other STDs can be time-consuming and difficult, it is crucial for the health and well-being of at-risk MSM.

If it seems a patient may be holding something back, make statements and ask questions such as:

- "I’m going to need you to be more explicit. Was the sexual contact genital, oral, or anal? With males or females or both?"
- "How many sexual partners are you talking about?"
- "How do drug and alcohol use relate to your sexual behavior, if at all?"
- "Have you ever been diagnosed with an STD?"
- "Do you know whether your partner(s) has ever been diagnosed and treated for an STD?"
- "When was the last time you were screened for HIV or other STDs?"

Please use A Guide to Taking a Sexual History to help you with this process. Additionally, using the Sexual History Discussion Form for each patient and including it in their medical records will be an easy way for you to track changes in patients’ sexual health.
**PREPARE YOUR PATIENTS**

The responses you get from a patient and the way he reacts throughout the discussion of syphilis and other STDs will guide you regarding the extent and type of education you might need to provide for each patient. You may decide to introduce some of the information below during different stages of an office visit as appropriate.

- “After 10 years of decline, syphilis cases are on the rise among MSM in New York, cases more than doubled from 2000 to 2001.”
- “The rate of primary and secondary syphilis among men increased 13.5 percent between 2002 and 2003.”
- “There have been outbreaks among MSM in other cities too. Just in the past few years, Seattle, Chicago, San Francisco, and Miami have had outbreaks. A lot of MSM with syphilis also have HIV. If you have syphilis, it makes your chances of contracting HIV two to five times greater.”
- “There is a rapid test for HIV. You can get preliminary results back in about 20 minutes.”
- “Getting tested for syphilis should be part of your routine medical care every year.”
GET INVOLVED

You and other health care professionals are a vital part of the community mobilization effort to conquer syphilis. You may want to cooperate with medical societies, community-based organizations, HIV prevention planners, and advocacy groups to strengthen linkages between prevention and clinical services. You can contribute to SEE efforts by:

- making sexual history taking a part of your routine care (Sexual History Discussion Form, and A Guide to Taking a Sexual History are provided to make this a relatively easy process);
- using the Syphilis–Physician’s Pocket Guide as a reference when screening patients for syphilis;
- reporting syphilis cases to local health departments;
- hosting community screenings — either independently or in collaboration with other clinics or practices;
- volunteering to screen at community health fairs and MSM community events such as gay pride parades;
- displaying SEE posters in your office waiting room;
- joining a SEE community coalition of leaders and experts who cooperate on strategies to mobilize the community for syphilis elimination;
- incorporating syphilis transmission, screening, and treatment information into HIV/AIDS or STD educational classes and one-on-one patient counseling.
developing a resource list so you and your staff can refer patients to:

- Local community centers
- Counseling services such as support groups, mental health services, and health education facilities
- Legal resources
- Gay-friendly sub-specialists and other providers

Any visit to a health care setting represents an opportunity to diagnose and treat syphilis and other STDS, thus a chance to decrease transmission of HIV. Test your patients for syphilis annually and whenever reported behaviors necessitate it. You will help eliminate a curable disease and contribute to your patients’ optimum health.

Your involvement is crucial to the success of SEE.

If you have specific questions about SEE that are not addressed in this guide or you would like to know how to become a member of SEE, visit the CDC Web site at www.cdc.gov/std/see/ or call your local health department.

**QUICKLY ASKED QUESTIONS**

What if patients refuse to answer questions about their sexual history and practices?

Acknowledge your patient’s feelings and emphasize that respect for patients’ privacy is part of your practice’s policy. Try to put the patient at ease by asking questions about his life in general, such as, “What do you do for fun?” and “Where do you like to go when you go out?” and “Are you involved in a relationship or dating?” As the patient feels more comfortable and begins to open up, ask a general question related to sex such as, “How would you rate your sex life on a scale of 1 to 10?”

A GUIDE FOR HEALTH CARE PROFESSIONALS 11
How do I encourage MSM engaging in risky sex to change their behavior?

Statements like, “I get a sense that you’re not too worried about the risk of getting HIV, syphilis, and other STDs. What would it take to make regular condom use part of your sexual life?” demonstrate empathy and show the patient that you are willing to help. Emphasize the patient’s choice and control with statements such as, “Only you can decide to guard your sexual health.” If you suspect the patient might be depressed, be using drugs and alcohol to excess, or have a partner violence problem, try a statement such as, “I’m sure you know the possible consequences of unprotected sex, and I wonder if other issues such as depression might be preventing you from protecting yourself. Could we explore that?” Follow up with, “I know a colleague who might be able to help you with this issue,” and refer him for additional services as appropriate.

How do I overcome a patient’s resistance to being tested?

Warn the patient that syphilis can often go undetected and that its long-term consequences can include blindness, neurological damage, and death. Tell him that syphilis is cured with a simple treatment regimen. Most importantly, emphasize the fact that syphilis increases a person’s chances of contracting and transmitting HIV.

How do I answer a patient who objects to having his name reported should he test positive?

Explain to the patient that reporting syphilis cases is a matter of law. However, since syphilis is a curable disease, having his name in the public record is not serious cause for concern. Reassure him that such records are confidential.
