DATA ILLUMINATES OPTIONS FOR Neurological Health
Using Data to Expand Understanding

National Neurological Conditions Surveillance System (NNCSS)
In 2016, as part of the 21st Century Cures Act, Congress authorized CDC to initiate development of the NNCSS. In response, CDC will use existing data and emerging tools to create an efficient approach for collecting and synthesizing surveillance data that will increase understanding of neurological disorders and facilitate further research. Fiscal year 2019 activities focus on starting demonstration projects to determine the prevalence and incidence for multiple sclerosis (MS) and Parkinson’s disease (PD).

Why It Matters
Millions of people across the United States face substantial and sometimes devastating consequences from neurological disorders. The NNCSS will expand understanding of these conditions and the information will be used to improve health outcomes for people of all ages. Ultimately, the NNCSS will be a robust system that can:

- Calculate estimates of incidence (number of new cases) and prevalence (number of people with a condition) for a range of neurological conditions
- Improve overall surveillance and understanding of neurological conditions
- Strengthen stakeholder collaboration and shared resources
- Improve awareness and support for neurological conditions
- Encourage research into the causes and treatment of neurological conditions

“This project will shine a light on the incidence and prevalence of often neglected neurological conditions and the impact they have on the public’s health.”
— Shawna Mercer, PhD, MSc
National Neurological Conditions Surveillance System Lead, CDC
