U.S. Preventive Services Task Force Recommendation Statement: Screening for Latent Tuberculosis Infection (LTBI) in Adults

Centers for Disease Control and Prevention

Division of Tuberculosis Elimination

September 2016
Background

The U.S. Preventive Services Task Force (USPSTF) published a new recommendation to test for latent tuberculosis (TB) infection (LTBI) in populations at increased risk.

The TB community has a unique opportunity to use the announcement of this recommendation to draw attention to LTBI and educate the public, health care providers, at-risk populations, and policy makers on the importance of targeted testing and treatment for LTBI.
Key Messages of this Presentation

1. Eliminating TB in the United States requires expanding testing and treatment of LTBI.

2. The Centers for Disease Control and Prevention (CDC) and the USPSTF recommend testing populations that are at increased risk for TB infection.

3. Clinicians, health care agencies, and community organizations, especially those serving at-risk populations, have a critical role in TB elimination.
LTBI in the United States

- Up to 13 million people in the United States are estimated to have LTBI.
  - While TB disease is a nationally notifiable disease, LTBI is not reported to CDC.
  - Despite declines of TB disease in the United States, there has been no significant change in the rate of LTBI over the last decade.
- More than 85% of U.S. TB cases are believed to be associated with longstanding untreated LTBI.
Addressing LTBI to Accelerate TB Elimination

- CDC’s Division of Tuberculosis Elimination has a central role in encouraging expansion of LTBI testing and treatment in the United States.
- Targeted testing and treatment of persons at greatest risk for TB is the most effective way to further reduce the number of new TB cases in the United States.
U.S. Preventive Services Task Force (USPSTF)
The USPSTF is an independent, volunteer panel of national experts in prevention and evidence-based medicine.

The primary goal of the USPSTF is to develop and disseminate evidence-based recommendations about clinical preventive services such as screenings, counseling services, and preventive medications.

Recommendations are developed based on rigorous review of existing peer-reviewed evidence, and evaluation of benefits and harms.

Recommendations address only services offered in the primary care setting or services referred by a primary care clinician.

Recommendations apply only to people who have no signs or symptoms of the specific disease or condition that the screening, counseling, or preventive medication targets.

Recommendations are available online and in peer-reviewed literature.

Every USPSTF recommendation is assigned a letter grade. These grades are based on the strength of the evidence on a specific preventive service.

<table>
<thead>
<tr>
<th>Grade</th>
<th>Definition</th>
<th>Suggestions for Practice</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>The USPSTF recommends the service. There is high certainty that the net benefit is substantial.</td>
<td>Offer or provide this service.</td>
</tr>
<tr>
<td>B</td>
<td>The USPSTF recommends the service. There is high certainty that the net benefit is moderate or there is moderate certainty that the net benefit is moderate to substantial.</td>
<td>Offer or provide this service.</td>
</tr>
<tr>
<td>C</td>
<td>The USPSTF recommends selectively offering or providing this service to individual patients based on professional judgment and patient preferences. There is at least moderate certainty that the net benefit is small.</td>
<td>Offer or provide this service for selected patients depending on individual circumstances.</td>
</tr>
<tr>
<td>D</td>
<td>The USPSTF recommends against the service. There is moderate or high certainty that the service has no net benefit or that the harms outweigh the benefits.</td>
<td>Discourage the use of this service.</td>
</tr>
<tr>
<td>I</td>
<td>The USPSTF concludes that the current evidence is insufficient to assess the balance of benefits and harms of the service. Evidence is lacking, of poor quality, or conflicting, and the balance of benefits and harms cannot be determined.</td>
<td>Read the clinical considerations section of USPSTF Recommendation Statement. If the service is offered, patients should understand the uncertainty about the balance of benefits and harms.</td>
</tr>

History of USPSTF LTBI recommendations

- 1996: USPSTF recommended (Grade A) LTBI screening of high-risk persons.
- 2002: USPSTF deferred to CDC LTBI testing recommendations to avoid duplication of other Federal Agency efforts (no USPSTF Grade issued).

For current recommendation

- 2013: CDC and the Agency for Healthcare Research and Quality signed an interagency agreement to initiate a review.
- 2014: USPSTF posted LTBI Research Plan for 30-day public comment period.
- 2016: USPSTF posted Recommendation and Evidence Review for 30-day public comment period.
- 2016: USPSTF published final Recommendation.
Questions Considered for USPSTF Recommendation

- **Benefits of screening**
  - Does screening for the disease result in decreased incidence?
  - Does screening result in reduced mortality or morbidity?
  - Are screening tests accurate and reliable?
  - Are sequential screening strategies accurate and reliable?

- **Risks of screening**
  - Are there harms to screening or the diagnostic work-up?

- **Benefits of treatment**
  - Does LTBI treatment reduce transmission of TB and mortality?

- **Risks of treatment**
  - Are there harms associated with treatment of LTBI?
2016 USPSTF Recommendation
2016 Recommendation

The USPSTF recommends screening for LTBI in populations that are at increased risk (B recommendation)

*B Recommendation = USPSTF recommends this service. There is high certainty that the net benefit is moderate or there is moderate certainty that the net benefit is moderate to substantial.
2016 USPSTF Recommendation

- This recommendation applies to asymptomatic adults ≥18 years of age who are at increased risk for TB and are seen in primary care settings.
  - Born in, or former residents of, countries with increased tuberculosis prevalence (e.g., Mexico, Philippines, Vietnam, India, China, Haiti, Guatemala)
  - Currently live in, or have lived in, high-risk congregate settings (e.g., homeless shelters, long-term care facilities, correctional facilities)

- It does not apply to adults with symptoms of TB disease or children and adolescents (children and adolescents screening addressed in Bright Futures).
Additional Populations at Risk for LTBI

- The recommendation does not address the additional need for LTBI testing in other high-risk populations.
- CDC recommends the following populations continue to be tested for LTBI as part of other screening efforts:
  - Persons with immunosuppression: TB testing is included in standards of care for disease or medical management for HIV/AIDS, immunosuppressive medications, and silicosis.
  - Persons who are contacts of persons with active TB disease: TB testing is conducted as part of public health programs.
  - Health care workers and workers in high-risk congregate settings: TB testing is conducted as part of employee health programs.
Bright Futures: TB Testing for Children

- Bright Futures is a national health promotion and prevention initiative, led by the American Academy of Pediatrics and supported by the Maternal and Child Health Bureau, Health Resources and Services Administration.
- Bright Futures recommends TB testing for children at high-risk, and many health plans are required to cover the service under the Patient Protection and Affordable Care Act (ACA) at no-cost.
Implications of USPSTF Recommendation for Public Health
Strategic Implications of Recommendation

- USPSTF recommendation can serve as a catalyst for increasing focus on LTBI targeted testing and treatment, particularly in persons who reside in, but were born outside of, the United States.
- The recommendation is a critical tool for moving TB elimination efforts forward by addressing the reservoir of LTBI.
Relation to the Patient Protection and Affordable Care Act (ACA)

- Under the law, preventive services with a USPSTF Grade of A or B are covered without cost-sharing (e.g., copayment or deductible) by many health insurance plans or policies.
- Plans subject to this requirement (i.e. “nongrandfathered” plans) must comply within the first plan year that begins one year after the September 6, 2016 USPSTF recommendation.
  - For example, plan years that begin January 1st will have to comply by January 1, 2018 at the latest.
Impact to Medicare and Medicaid

- For LTBI screening without cost-sharing to be available to Medicare beneficiaries, the Centers for Medicare and Medicaid Services must first complete a Medicare National Coverage Determination.
- LTBI screening may not be available without cost-sharing to traditional Medicaid beneficiaries.
- LTBI screening may be available to Medicaid beneficiaries enrolled in alternative benefit plans.
Implications of USPSTF Recommendation for Clinical Practice
USPSTF Recommendation: Implications for Clinical Practice (1)

- TB control and prevention has traditionally been a function of state and local public health departments.
- However, many people at high risk for TB infection and TB disease who need to be tested and treated receive care from private healthcare providers and community health centers.
- The USPSTF recommendation expands opportunities for additional public and private health care providers to prevent and control TB.
- Providers should consult with their local or state health departments for populations at risk in their communities based on local demographic patterns.
**USPSTF Recommendation: Implications for Clinical Practice (2)**

- In the near future, many health plans should cover LTBI screening without cost-sharing for at-risk asymptomatic adults age ≥18 years in the following groups when using a provider within the health plan’s network:
  - Persons born in, or former residents of, countries with increased TB prevalence
  - Persons who currently live in, or have lived in, high-risk congregate settings
- Other adults assumed to be at risk for LTBI may incur cost of co-pays, co-insurance, or deductibles for LTBI screening (depending on type of health coverage and setting in which screening is provided).

In Summary

- TB cannot be eliminated in the United States without increased efforts to test and treat LTBI.
- The USPSTF recommends screening for LTBI in adult populations that are at increased risk (B recommendation).
- USPSTF recommendation is a catalyst for increasing focus on LTBI targeted testing and treatment.
- The USPSTF recommendation expands opportunities for private health care providers to play a critical role in TB control and prevention.
