

Self-Study Modules on Tuberculosis

Infectiousness and Infection Control

Module 5: Objectives

At completion of this module, learners will be able to:

1. Describe the factors that determine the infectiousness of a TB patient
2. Describe the main goals of a TB infection-control program
3. Describe the three levels of control measures that are the basis of an effective TB infection-control program
4. Describe the purpose and the characteristics of a TB airborne infection isolation (AII) room
5. Describe the circumstances when personal respirators should be used

Module 5 – Infectiousness and Infection Control

2

Module 5: Overview

- Infectiousness
- TB Infection Control
 - TB Infection Control Measures
 - TB Risk Assessment
 - Infection Control in Nontraditional Facility-Based Settings
 - TB Infection Control in the Home
- Case Studies

Module 5 – Infectiousness and Infection Control

3

Infectiousness

4

Infectiousness (1)

- Infectiousness is directly related to number of tubercle bacilli TB patients expel into air
- TB patients generally expel more tubercle bacilli if their cough produces a lot of sputum
- Only people with TB of the lungs, airway, or larynx are infectious

Module 5 – Infectiousness and Infection Control

5

Infectiousness (2)

Factors generally associated with infectiousness:

• Presence of cough	• Not covering mouth when coughing
• Cavity in the lung	• Not receiving adequate treatment or prolonged illness
• Acid-fast bacilli on sputum smear	• Undergoing cough inducing procedures
• TB of lungs, airway, or larynx	• Positive sputum cultures

Module 5 – Infectiousness and Infection Control

6

Infectiousness (3)

- Infectiousness appears to decline rapidly after adequate treatment is started; however:
 - How quickly infectiousness declines varies from patient to patient (weeks to months)
 - Patients with drug-resistant TB may not respond to initial drug regimen; meaning they may remain infectious for longer

Module 5 – Infectiousness and Infection Control

7

Infectiousness (4)

- Patients can be considered non-infectious when they meet all of the following criteria:
 - Received adequate treatment for 2 weeks or longer
 - Symptoms have improved
 - Three consecutive negative sputum smears from sputum collected in 8 to 24 hour intervals (at least one early morning specimen)

Module 5 – Infectiousness and Infection Control

8

Infectiousness (5)

- Children are less likely than adults to be infectious
 - Children generally do not produce a lot of sputum when they cough
- Young children can still transmit TB if they exhibit signs of infectiousness

Module 5 – Infectiousness and Infection Control

9

Infectiousness Study Question 5.1

List 7 factors that affect the infectiousness of a TB patient.

Module 5 – Infectiousness and Infection Control

10

Infectiousness Study Question 5.2

Why does the site of disease affect the infectiousness of a TB patient?

Module 5 – Infectiousness and Infection Control

11

Infectiousness Study Question 5.3

When can a TB patient be considered noninfectious? List all 3 criteria.

Module 5 – Infectiousness and Infection Control

12

TB Infection-Control Program (2) Detection of TB disease

- HCWs should suspect TB disease in anyone with any of these symptoms:
 - Persistent cough
 - Chest pain
 - Bloody sputum
 - Weight loss or loss of appetite
 - Fever
 - Chills
 - Night sweats

Module 5 – Infectiousness and Infection Control

19

TB Infection-Control Program (3) Detection of TB disease

- When a health care worker suspects that a patient has TB disease, the patient should be:
 - Placed in an area away from other patients and evaluated
 - Given a surgical mask to wear
 - Given tissues and asked to cover nose and mouth when coughing or sneezing

Module 5 – Infectiousness and Infection Control

20

TB Infection-Control Program (4) Airborne Precautions

- Airborne precautions should be taken for any person who has signs or symptoms of TB disease
- If facility has an AII room, TB suspects and TB patients should be placed there
- Health care settings, such as TB clinics, should implement a respiratory-protection program

Module 5 – Infectiousness and Infection Control

21

TB Infection-Control Program (5) Treatment

- Patients diagnosed with TB should start treatment immediately
- DOT should be used to ensure adherence

Module 5 – Infectiousness and Infection Control

22

TB Infection Control Study Question 5.4

Under what circumstances is TB most likely to be transmitted in health care facilities?

Module 5 – Infectiousness and Infection Control

23

TB Infection Control Study Question 5.5

How can the health department assist health care settings in preventing the spread of TB?

Module 5 – Infectiousness and Infection Control

24

TB Infection Control Study Question 5.6

What are the main goals of a TB infection-control program?

TB Infection Control Study Question 5.7

What would make a health care worker suspect that a patient has TB disease?

TB Infection Control Study Question 5.8

What should be done when a health care worker suspects that a patient has TB disease?

TB Infection Control TB Infection Control Measures

TB Infection Control Measures (1) Hierarchy of Infection Control

Administrative Controls

Environmental Controls

Respiratory Protection

TB Infection Control Measures (2)

Three levels of control measures:

- **Administrative controls:** managerial measures to reduce risk of exposure to *M. tuberculosis*
- **Environmental controls:** engineering systems to prevent the spread of and reduce the concentration of infectious *M. tuberculosis* droplet nuclei in air
- **Respiratory-protection controls:** personal protection to further minimize risk for exposure to *M. tuberculosis*

Environmental Controls

- Second level of infection-control program
- Consist of technologies that are designed to prevent the spread and reduce the concentration of TB in the air
 - Ventilation technologies
 - High efficiency particulate air filtration (HEPA)
 - Ultraviolet germicidal irradiation (UVGI)

Module 5 – Infectiousness and Infection Control

37

Ventilation Technologies (1)

- Ventilation is the movement of air in a building and the replacement of air inside with air from outside
- Ventilation technologies include:
 - Natural ventilation
 - Mechanical ventilation

Module 5 – Infectiousness and Infection Control

38

Ventilation Technologies (2) Natural Ventilation

- Doors and windows should be open
- Fans can be used to distribute air
- HCW should sit near fresh air source
- Can be useful for nontraditional settings that do not have a central ventilation system

Module 5 – Infectiousness and Infection Control

39

Ventilation Technologies (3) Mechanical Ventilation

- Refers to the use of technological equipment to circulate and move air
- Consists of two types of technologies
 - Local exhaust ventilation
 - General ventilation
- Should be used by hospitals, TB clinics, and other settings where TB patients are expected

Module 5 – Infectiousness and Infection Control

40

Ventilation Technologies (4) Mechanical Ventilation

- Local exhaust ventilation
 - Stops airborne contaminants from spreading into general environment
 - Includes external hoods, booths, and tents
 - Should be used for cough-inducing procedures

Module 5 – Infectiousness and Infection Control

41

Ventilation Technologies (5) Mechanical Ventilation

- General ventilation systems:
 - Dilute contaminated air
 - Remove contaminated air
 - Control airflow patterns in patient and procedure rooms (e.g., negative pressure in AII room)

Module 5 – Infectiousness and Infection Control

42

Respiratory-Protection Controls (3) Personal Respirators

- Important that respirator fits properly:
 - Fit test used to determine which respirator to wear
 - User seal check should be done each time a respirator is put on

Health care worker undergoing a fit test
Image credit: Paul Jensen

Module 5 – Infectiousness and Infection Control

49

Respiratory-Protection Controls (4) Personal Respirators

- Respirators that can be used to protect against *M. tuberculosis*:
 - Nonpowered respirators with N95, N99, N100, R95, R99, R100, P95, P99, and P100 filters
 - Powered air-purifying respirators (PAPRs) with high-efficiency filters
 - Supplied-air respirators

Image credit: Greg Knobloch

Module 5 – Infectiousness and Infection Control

50

Respiratory-Protection Controls (5) Respirators and Surgical Masks

- Important to understand the difference between respirators and surgical masks
 - Respirators protect individuals from inhaling droplet nuclei
 - Surgical masks stop droplet nuclei from being exhaled into air by infectious TB patients or suspects

Module 5 – Infectiousness and Infection Control

51

Respiratory-Protection Controls (6) Respirators

Health care worker wearing a personal respirator

Module 5 – Infectiousness and Infection Control

52

Respiratory-Protection Controls (7) Surgical Masks

Patient wearing a surgical mask

Module 5 – Infectiousness and Infection Control

53

TB Infection-Control Study Question 5.9

What are the three levels of control that form the basis of a TB infection-control program?

Module 5 – Infectiousness and Infection Control

54

Administrative Controls Study Question 5.10

List 5 administrative control measures that should be taken in health care settings to reduce the risk of exposure to persons who may have TB disease.

Module 5 – Infectiousness and Infection Control

55

Environmental Controls Study Question 5.11

Where should sputum induction, bronchoscopy, or other cough-inducing procedures be done?

Module 5 – Infectiousness and Infection Control

56

Environmental Controls Study Question 5.12

What is a TB AII room? What are the important characteristics of an AII room?

Module 5 – Infectiousness and Infection Control

57

Ventilation Systems Study Question 5.13

How do ventilation systems help prevent the spread of TB?

Module 5 – Infectiousness and Infection Control

58

Ventilation Systems Study Question 5.14

Give 4 examples of settings where personal respirators should be used.

Module 5 – Infectiousness and Infection Control

59

Respiratory Protection-Controls Study Question 5.15

What is the difference in use between a respirator and a surgical mask?

Module 5 – Infectiousness and Infection Control

60

TB Infection Control

TB Risk Assessment

61

TB Risk Assessment (1)

- Administrative control measure
- Helps to inform infection control plan
- Determines types of controls needed for setting
- Serves as an initial and ongoing monitoring and evaluation tool for infection-control program
- Helps determine frequency of employee testing

Module 5 – Infectiousness and Infection Control

62

TB Risk Assessment (2)

- Risk assessment examines many factors, including:
 - Number of patients with TB disease in setting
 - Promptness of detection, isolation, and evaluation of patients with suspected or confirmed TB
 - Evidence of transmission of *M. tuberculosis* in setting
 - Community rate of TB disease

Module 5 – Infectiousness and Infection Control

63

TB Risk Classification

- Low risk
 - Persons with TB disease are not expected to be encountered
- Medium risk
 - Possible exposure to persons with TB disease
 - Possible exposure to clinical TB specimens
- Potential ongoing transmission
 - Setting where there is evidence of person-to-person transmission of *M. tuberculosis* in past year

Module 5 – Infectiousness and Infection Control

64

TB Testing Frequency

TB Risk Classification	Frequency for TB Testing
Low Risk	<ul style="list-style-type: none"> • Conduct baseline test when health care worker is hired • No further testing needed unless exposure occurs
Medium Risk	<ul style="list-style-type: none"> • Conduct baseline test when health care worker is hired • Repeat test annually
Potential Ongoing Transmission	<ul style="list-style-type: none"> • Conduct baseline test when health care worker is hired • Repeat test every 8 to 10 weeks until there is no evidence of <i>M. tuberculosis</i> transmission in setting

Module 5 – Infectiousness and Infection Control

65

TB Infection Control

Infection Control in Nontraditional Facility-Based Settings

66

Special Considerations (1)

- Nontraditional facility-based settings where TB patients receive care should establish and follow an infection-control program
- Includes settings such as:
 - Nursing homes
 - Correctional facilities
 - Homeless shelters
 - Drug treatment centers
 - Emergency medical services
 - Home-based health care
 - Outreach settings

Module 5 – Infectiousness and Infection Control

67

Special Considerations (2) Correctional Facilities

- Medical settings within correctional facilities should:
 - Classify as medium risk or higher
 - Test all staff annually
 - Implement a respiratory-protection program with at least one AII room

Module 5 – Infectiousness and Infection Control

68

Special Considerations (3) Correctional Facilities

- Medical settings within correctional facilities should (cont.):
 - Have inmates with suspected or confirmed TB disease wear surgical mask when transported
 - Establish and maintain a tracking system for inmate testing and treatment

Module 5 – Infectiousness and Infection Control

69

Special Considerations (4) Homeless Shelters

- Should observe the same TB infection-control measures as outpatient clinics
- Several factors in shelter environment can influence likelihood of TB transmission:
 - Crowdedness of shelter
 - Ventilation system of shelter

Module 5 – Infectiousness and Infection Control

70

Special Considerations (5) Emergency Medical Services (EMS)

- EMS workers should be included in TB testing program based on risk for the setting
- Persons with infectious TB who are transported in ambulance should wear surgical mask
- Drivers, health care workers, and other staff should consider wearing a respirator
- Ambulance should allow for maximum amount of outdoor air to be circulated in vehicle

Module 5 – Infectiousness and Infection Control

71

Special Considerations (6) Long-Term Care Facilities (LTCFs)

- LTCFs (e.g., hospices and nursing homes) should:
 - Symptom screen and possibly test new employees and residents
 - Have administrative and environmental controls **IF** they accept patients with infectious TB
- Persons with TB disease who are non-infectious can stay in LTCFs and do not need AII room

Module 5 – Infectiousness and Infection Control

72

TB Infection Control

TB Infection Control in the Home

73

TB Infection Control in the Home (1) **Patient Returning Home**

TB patients and TB suspects may be sent home after starting treatment, even though they may be infectious

Module 5 – Infectiousness and Infection Control

74

TB Infection Control in the Home (2) **Patient Returning Home**

- **Criteria for patient to return home:**
 - Follow-up plan has been made with the local TB program
 - Patient on TB treatment and DOT arranged
 - No infants or children younger than 5 years of age or persons with immunocompromising conditions in home

Module 5 – Infectiousness and Infection Control

75

TB Infection Control in the Home (3) **Patient Returning Home**

- **Criteria for patient to return home (cont.):**
 - All household members have already been exposed to TB patient
 - Patient is willing to not travel outside of home until sputum smear results are negative

Module 5 – Infectiousness and Infection Control

76

TB Infection Control in the Home (4) **Patient Returning Home**

- TB patients and members of household should take steps to prevent spread of TB
- Patients with TB should be instructed to:
 - Cover mouth and nose with tissue when coughing or sneezing
 - Sleep alone
 - Not have visitors until noninfectious

Module 5 – Infectiousness and Infection Control

77

TB Infection Control in the Home (5) **Health Care Workers (HCWs)**

- **HCWs should:**
 - Be trained in detecting TB signs and symptoms
 - Take precautions to protect themselves:
 - Instruct patient to cover mouth when coughing
 - Wear personal respirator
 - Collect sputum in well-ventilated areas
 - Participate in TB testing and prevention programs

Module 5 – Infectiousness and Infection Control

78

TB Risk Assessment Study Question 5.16

What are 3 different TB risk classifications that can be assigned to health care settings?

Module 5 – Infectiousness and Infection Control

79

TB Risk Assessment Study Question 5.17

Depending on risk classification, how often should health care settings test workers for TB?

Module 5 – Infectiousness and Infection Control

80

TB Infection Control in the Home Study Question 5.18

What precautions should a health care worker take when visiting the home of a TB patient who may be infectious?

Module 5 – Infectiousness and Infection Control

81

Case Studies

82

Module 5: Case Study 5.1

For each of the following situations, decide whether the patient should be considered infectious or non-infectious, and explain why.

Module 5 – Infectiousness and Infection Control

83

Module 5: Case Study 5.1 Question 5A

Two weeks ago, Mr. Lopez had a sputum smear that was positive; since then no sputum specimens have been tested. Mr. Lopez started self-administered TB treatment 7 days ago. He still has a cough.

Module 5 – Infectiousness and Infection Control

84

Module 5: Case Study 5.1
Question 5A: Answer

Module 5 – Infectiousness and Infection Control

85

Module 5: Case Study 5.1
Question 5B

Ms. Nguyen, a patient with pulmonary TB, has been receiving DOT treatment for 6 weeks and no longer has symptoms of TB. She has had three sputum smears. The first one was positive, but the last two were negative.

Module 5 – Infectiousness and Infection Control

86

Module 5: Case Study 5.1
Question 5B: Answer

Module 5 – Infectiousness and Infection Control

87

Module 5: Case Study 5.1
Question 5C

Mr. Martin started DOT treatment for pulmonary TB in April. His symptoms went away and his sputum smears were negative in May. However, the outreach worker was unable to locate him on June 5th and has not been able to contact him since that time. Mr. Martin returned to the TB clinic on August 2nd, and was still coughing.

Module 5 – Infectiousness and Infection Control

88

Module 5: Case Study 5.1
Question 5C: Answer

Module 5 – Infectiousness and Infection Control

89

Module 5: Case Study 5.2 (1)

You are checking patients into the TB clinic. An elderly man comes to the desk and says he was told to come and get checked because one of his friends has TB. You notice that he looks sick and is coughing frequently. The waiting room is full of patients, and you know it will probably be more than an hour before the physician can see him.

Module 5 – Infectiousness and Infection Control

90

Module 5: Case Study 5.2 (2)

- What should you do?

Module 5 – Infectiousness and Infection Control

91

Module 5: Case Study 5.3 (1)

You are sent to deliver directly observed therapy (DOT) to a woman who started treatment last week for suspected pulmonary TB. Her sputum smear results are not back yet. You are asked to collect another sputum specimen while you are at the woman's home.

Module 5 – Infectiousness and Infection Control

92

Module 5: Case Study 5.3 (2)

- What precautions should you take?

Module 5 – Infectiousness and Infection Control

93
