Introduction

This document contains the questions on the 2013-2014 National Adult Tobacco Survey (NATS) conducted by the CDC’s Office on Smoking and Health (OSH), in partnership with the Food and Drug Administration’s Center for Tobacco Products (FDA-CTP).

In 1999, the CDC’s Office on Smoking and Health (OSH) created the National Tobacco Control Program (NTCP) to encourage coordinated, national efforts to reduce tobacco use and tobacco-related diseases and deaths. In 2009, Congress’ the Family Smoking Prevention and Tobacco Control Act (FSPTCA) gave the Food and Drug Administration (FDA) the authority to regulate tobacco products. These regulatory changes are expected to influence tobacco product use patterns and to reduce tobacco-related morbidity and mortality. Tracking patterns of tobacco use over time is a shared interest for both the Centers for Disease Control and Prevention’s Office on Smoking and Health (OSH) and the FDA’s Center for Tobacco Products (CTP). The National Adult Tobacco Survey is intended to provide surveillance and evaluation data critical for evaluating the impact of the CDC’s National Tobacco Control Program (NTCP) and the FDA’s regulatory efforts. So, this survey includes measures on key outcome indicators critical to evaluating and monitoring CDC’s NTCP and questions on new and emerging tobacco products, as well as measures relevant to the impact of FDA’s regulatory activities which ensure that its efforts are protecting the public’s health.

The purpose of this introduction is to provide the reader with information that will help in understanding and navigating the questionnaire.

The NATS is a stratified, random-digit dialed, telephone survey of non-institutionalized adults 18 years of age and older. It is designed to yield data that are representative and comparable at the national level.

The sections of the NATS questionnaire capture information used to monitor the impact of FDA activities. These sections are:

1. Cigarette use patterns – Cigarettes are by far the largest contributor to tobacco-related disease and death in the U.S., and the questions in this section assess current and past usage patterns. Many of these questions are consistent with those asked in the previous version of NATS.
2. Susceptibility (cigarettes) – These questions are asked among young adults to gauge non-smokers’ susceptibility to cigarette smoking initiation. These are a subset of questions used to assess susceptibility among youth in NYTS, based on research by John Pierce.
3. Other tobacco products – As cigarettes have become increasing regulated and with the potential for future marketing of modified risk tobacco products, FDA needs to monitor awareness, use, susceptibility, and risk perceptions of non-cigarette tobacco products.
4. Addiction (all tobacco) – The most significant driver of continued use and relapse, addiction will be important to monitor, specifically as tobacco product changes are implemented.
5. Cessation – Standard measures of intention to quit, quit attempts, and quitting success, both for cigarettes and all tobacco products.
6. Marketing/Public Education – The Tobacco Control Act gives FDA the authority to regulate the marketing of tobacco products and to educate the public about the harms of tobacco products. These questions measure exposure to different types of marketing and promotion and responses to health warnings on packages and advertisements.
7. **Purchasing behavior (cigarettes)** – Monitoring smokers’ purchasing patterns and use of price promotions will enable FDA to assess the impact of regulatory actions regarding the marketing and distribution of tobacco products, as well as identify emerging marketing practices.

8. **Demographics** – Important covariates to identify differential impacts of regulatory actions among subpopulations.

9. **Knowledge/Attitudes/Perceptions** – These questions measure short-term outcomes of efforts to inform the public of the health risks associated with tobacco products, which predict intentions and behaviors.

10. **Secondhand smoke** – A few questions were kept from the previous version of NATS to measure social norm changes and perceptions about the harmful effects of SHS to non-smokers, one of the warning statements on the cigarette graphic health warnings.

The CDC uses the data collected by this study to develop more effective public health programs. Your household’s participation is voluntary and important to the success of this study.

First, I need to randomly select one adult who lives in your household to be interviewed. How many members of your household, including yourself, are 18 years of age or older?

[IF NEEDED: Do not include students living away at school. Include adults who think of this household as their primary place of residence. Include adults who usually stay in the household but are temporarily away on business, vacation, or in a hospital.]

Rationale (CDC): This question allows for the evaluation of Key Outcome Indicators 2.7.3, 2.7.5. With the increasing number of restrictions on smoking in public areas, private areas such as homes and vehicles are becoming larger sources of exposure. The home is the primary source of secondhand smoke exposure for children.

Rationale: This question allows for the evaluation of Key Outcome Indicator 2.4.3. It combines two questions from the 2009-2010 NATS questionnaire that assessed worksites policies in outdoor and indoor areas separately. Worksites are an important source of secondhand exposure for individuals residing in states and localities without comprehensive smoke-free policies prohibiting smoking in indoor areas of worksites, restaurants, and bars.

Rationale: This question allows for the evaluation of Key Outcome Indicators 2.7.3 and 2.7.5. With the increasing number of restrictions on smoking in public areas, the home has become an important source of secondhand smoke exposure for many individuals, particularly children. Individuals who live in multiunit housing are particularly susceptible to SHS incursions from nearby units and shared areas.
