Phased Allocation of COVID-19 Vaccines

Kathleen Dooling, MD, MPH
ACIP meeting
December 20, 2020
Objective

Policy Question:

Which groups should be offered COVID-19 vaccination in Phase 1b & 1c?
Work Group Considerations: Goals of the COVID-19 Vaccine Program

- Ensure safety and effectiveness of COVID-19 vaccines
- Reduce transmission, morbidity, mortality of COVID-19 disease
- Help minimize disruption to society and the economy, including maintaining healthcare capacity
- Ensure equity in vaccine allocation and distribution
Work Group considerations: Balancing Goals

Prevention of Morbidity & Mortality

Preservation of Societal Functioning
Work Group considerations: Balancing Goals

Prevention of Morbidity & Mortality

1a LTCF residents

● Ensure safety and effectiveness of COVID-19 vaccines
● Ensure equity in vaccine allocation and distribution

Preservation of Societal Functioning

Health care personnel
Work Group considerations: Balancing Goals

- 10 public ACIP meetings, 28 COVID-19 Work Group meetings
- Evidence: Scientific, Implementation, Ethical
- External Expert Advice

NASEM Framework

Essential Workers* (total ~87M)

Frontline Essential Workers (~30M)
- First Responders (Firefighters, Police)
- Education (teachers, support staff, daycare)
- Food & Agriculture
- Manufacturing
- Corrections workers
- U.S. Postal service workers
- Public transit workers
- Grocery store workers

Other Essential Workers (~57M)
- Transportation and logistics
- Food Service
- Shelter & Housing (construction)
- Finance
- IT & Communication
- Energy
- Media
- Legal
- Public Safety (Engineers)
- Water & Wastewater

Frontline Essential Workers: workers who are in sectors essential to the functioning of society and are at substantially higher risk of exposure to SARS-CoV-2

Proposed Phases of COVID-19 Vaccination

- **Phase 1a:**
  - 16-64 years with high-risk medical conditions (>110M)
  - 16-64 years Without high-risk medical conditions (<86M)

- **Phase 1b:**
  - Essential Workers
  - Frontline
  - HCP

- **Phase 1c:**
  - 65-74 years (32M)
  - 75+ years (21M)

- **Phase 2:**
  - LTCF
Allocation of COVID-19 vaccine

Which groups should be recommended to receive COVID-19 vaccines in Phase 1b & 1c?
COVID-19 incidence is highest in young adults

National Estimate of COVID-19 Incidence per 100,000 Population, by Age Group – Data through Dec 16, 2020

Age Group (Years)  | COVID-19 Incidence per 100,000 Population
85+                | 5064
75-84              | 3147
65-74              | 2977
50-64              | 3993
40-49              | 4543
30-39              | 4671
18-29              | 5489
5-17               | 1944
0-4                | 1135

COVID-19 mortality rates are highest in older adults

National Estimate of COVID-19 Deaths per 100,000 Population, by Age Group – Data through Dec 16, 2020

Although overall mortality increases with age, the proportion of deaths associated with COVID-19 is similar across middle-age and older adults.

As of December 16th: https://www.cdc.gov/nchs/nvss/vsrr/covid_weekly/index.htm
Adults 75 years and older account for 25% of COVID-19 associated hospitalizations

Data Source: COVID-19 associated hospitalizations reported to Coronavirus Disease 2019 (COVID-19)-Associated Hospitalization Surveillance Network (COVID-NET) surveillance system. COVID-NET is a population-based surveillance system that collects data on laboratory-confirmed COVID-19-associated hospitalizations among children and adults through a network of over 250 acute-care hospitals in 14 states.
COVID-19-associated hospitalization rates are highest in older adults

Data Source: https://gis.cdc.gov/grasp/COVIDNet/COVID19_3.html
Risk for COVID-19 associated hospitalization increased with the number of underlying medical conditions

Other includes Dietary Service Staff, Environmental Service Staff and participants who selected Other and were not reassigned to an existing category
Other Health includes Student/Trainee, Respiratory Therapist, Occupational/Speech/Physical Therapist, Therapy Aide/Assistant, Pharmacist, Diagnostic Imaging Technician, Phlebotomist, Medical Registrar, Orderly, Dietician, Dentist, Clinical Technician, Medical Assistant. Sami et al. Manuscript in preparation.
Half of essential workers are older than 40 years

- 8-11% are ≥65 years old\(^1\)
- >56% of adults 18-64 years have ≥1 high-risk medical condition\(^2\)

1. Data Source: American Community Survey, 2019  
2. Data source: 2019 Behavioral Risk Factor Surveillance System
Summary of Work Group interpretation: Modeling

- In the scenarios considered, differences between strategies is minimal
  - Vaccinating older adults first averts slightly more deaths, vaccinating younger adults first (essential workers or younger adults with high-risk conditions) averts slightly more infections
  - Ethical principles and implementation considerations also contribute to selecting the optimal sequence in Phase 1b and 1c

- Largest driver of impact in averted deaths and infections is the timing of vaccine introduction in relation to increases in COVID-19 cases
  - Emphasizes the need to continue non-pharmaceutical interventions (e.g. wearing a mask, social distancing to prevent cases so vaccine can have maximum impact)

- Vaccine’s ability to prevent transmission will further inform future modeling analysis and interpretation

Impacts of COVID-19 not represented in models: Late Sequelae of COVID-19

Most commonly reported symptoms include:
fatigue, dyspnea, cough, arthralgia, and chest pain

More serious complications appear to be less common but have been reported:
- Cardiovascular: myocardial inflammation, ventricular dysfunction
- Respiratory: pulmonary function abnormalities
- Renal: acute kidney injury
- Dermatologic: rash, alopecia
- Neurological: olfactory and gustatory dysfunction, sleep dysregulation, altered cognition, memory impairment
- Psychiatric: depression, anxiety, changes in mood

Implementation
ACIP COVID-19 Vaccine Work Group: Proposed Guiding Principles

**Safety is paramount.** Vaccine safety standards will not be compromised in efforts to accelerate COVID-19 vaccine development or distribution.

**Inclusive clinical trials.** Study participants should reflect groups at risk for COVID-19 to ensure safety and efficacy data are generalizable.

**Efficient Distribution.** During a pandemic, efficient, expeditious and equitable distribution and administration of approved vaccine is critical.

**Flexibility.** Within national guidelines, state and local jurisdictions should have flexibility to administer vaccine based on local epidemiology and demand.
ACIP COVID-19 Vaccine Work Group: Proposed Guiding Principles

**Efficient Distribution.** During a pandemic, efficient, expeditious and equitable distribution and administration of authorized vaccine is critical.

**Flexibility.** Within national guidelines, state and local jurisdictions should have flexibility to administer vaccine based on local epidemiology and demand.
Feasibility

Adults ≥65 years

- **Challenge**: long distances to central clinics and high throughput of clinics
- Older adults report high intent to receive COVID-19 vaccine
- Physician offices, pharmacies and public health clinics are established providers of adult vaccination
- Population surveys report 73% - 82% of respondents supported priority vaccination of persons aged ≥65 years/elderly in polls conducted in December 2020 \(^{2,3}\)

Feasibility

Essential workers

- **Challenge**: reaching workers in rural locations, shift workers, those working multiple jobs or working in small cohorts
- Jurisdiction approaches include on site occupational clinics/pharmacies/Health Dept POD strike teams
- Population surveys report 68% - 87% of respondents supported prioritization of early allocation of COVID-19 vaccine supply to essential workers (eg. police/fire/rescue and teachers)¹⁻³

---

Feasibility

Adults with high-risk medical conditions

- **Challenges**: determining eligibility & very large group
- Healthcare homes, such as physician offices or pharmacies, could be better suited to verifying underlying medical conditions
- Population surveys report 68% - 84% of respondents supported prioritization of early allocation of COVID-19 vaccine supply to persons who are high risk because of medical problems

</tbody>
</table>
| **Mitigate Health inequities**          | - Increased prevalence of some medical conditions in race/ethnic minority groups & persons in rural areas  
                                          | - Diagnosis of medical conditions requires access to healthcare |
Summary of Work Group Considerations
Summary: Work Group considerations

- Scientific, implementation and ethical considerations support inclusion of groups in Phase 1b and 1c as a balance of prevention of morbidity and mortality and preservation of societal functions.

- This represents an interim Phase 1 sequence—allocation policy will need to be dynamic and adapt as new information such as vaccine performance and supply and demand become clear.

- Gating criteria will be necessary to move expeditiously from one Phase to the next, if supply exceeds demand.

- Following vaccination, measures to stop the possible spread of SARS-CoV-2, such as masks and social distancing, will still be needed.

- The U.S. government is committed to making COVID-19 vaccines available to all residents, as soon as possible.

ACIP Vote – Interim Recommendation

As an update to ACIP recommendations for vaccination in Phase 1a (health care personnel, and long-term care facility residents), if COVID-19 vaccine supply is limited, the following groups should be offered vaccination:

Phase 1b: persons aged ≥75 years and frontline essential workers

Phase 1c: persons aged 65–74 years, persons aged 16–64 years with high-risk medical conditions, and other essential workers
Thank you
