Virologic Surveillance

Influenza Positive Tests Reported to CDC by U.S. Clinical Laboratories, National Summary, October 3, 2021 – February 12, 2022
Influenza-like Illness Activity (ILINet)

Percentage of Outpatient Visits for Respiratory Illness Reported By The U.S. Outpatient Influenza-like Illness Surveillance Network (ILINet), Weekly National Summary, 2021-2022* and Selected Previous Seasons

This system monitors visits for ILI (fever and cough or sore throat), not laboratory confirmed influenza and may capture patient visits due to other respiratory pathogens that cause similar symptoms.
Influenza Hospitalizations (FluSurv-NET)

Cumulative Rate of Laboratory-Confirmed Influenza Hospitalizations among cases of all ages, 2015-16 to 2021-22, MMWR Week 06

**In this figure, cumulative rates for all seasons prior to the 2021-22 season reflect end-of-season rates. For the 2021-22 season, rates for recent hospital admissions are subject to reporting delays. As hospitalization data are received each week, prior case counts and rates are updated accordingly.**
Influenza Mortality
Recent U.S. Influenza Activity -- Summary

As of Week 6 (the week ending February 12, 2022):

- 3.0% of specimens submitted to clinical laboratories are positive (after peaking at 6% in week 50 and declining to ~2.0% during week 2).
  - Most specimens that are subtyped are H3N2 viruses.
  - These viruses are thus far genetically closely related to the vaccine virus, but there are some antigenic differences that have developed as H3N2 viruses continue to evolve.

- Sporadic influenza activity continues throughout the country.
  - Influenza is increasing in some parts of the country.

- The cumulative hospitalization rate (FluSurv-NET) is higher than that for the entire 2020-21 season, but lower than that observed at this time during the four seasons preceding the COVID-19 pandemic.
