Basics

- Store vaccine in a refrigerator.
  See guidance below for further details.
- Each carton contains 10 multidose vials (50 doses).
  - A carton is approximately 3.7 in x 3.7 in x 2.1 in.
  - Each multidose vial contains 5 doses.
- Check and record storage unit temperatures each workday.
  See guidance below for each type of temperature monitoring device. Save storage records for 3 years, unless your jurisdiction requires a longer time period.

Deliveries

Vaccine

1. The vaccine will arrive refrigerated between 2°C and 8°C (36°F and 46°F).
2. Examine the shipment for signs of damage.
3. Each shipment contains two temperature monitors.
   Open the box and remove both monitors.
   - The WarmMark monitor is located under the frozen gel packs at the top of the cooler.
   - The FreezeMark indicator is located inside the inner box, next to the vaccine.
4. Remove the instruction card for each temperature monitor immediately. Follow the guide on the back of each card to read the monitors.
5. The expiration date is NOT printed on the vaccine vial or carton. To determine the expiration date:
   - Scan the QR code on the outer carton, or
   - Call 1-800-565-4008, or
   - Visit www.vaxcheck.jnj.
   Write the expiration date on the carton.

Ancillary Supply Kit

- An ancillary supply kit will be provided and includes enough supplies to administer 100 doses of vaccine.
- Administration supplies include needles, syringes, sterile alcohol prep pads, vaccination record cards (shot cards), and some PPE.
- The kit is delivered separately from the vaccine. Unpack the kit and check for receipt of the correct administration supplies and quantities.
Refrigerator Storage

- CDC recommends storing vaccine between 2°C and 8°C (36°F and 46°F):
  - Unpunctured vials until the expiration date*
  - Punctured vials for up to 6 hours.† Note the date and time the vial was first punctured. Discard vaccine not used within this time.

- Do not freeze.
- Protect from light.
- As the expiration date approaches, determine if it has been extended using the same methods outlined in the "Deliveries" section. Do not discard vaccine without ensuring the expiration date has passed. Use CDC’s expiration date tracking tool to document expiration date changes.

Temperature Monitoring

Storage unit temperatures must be monitored regularly and checked and recorded at the beginning of each workday to determine if any excursions have occurred since the last temperature check. For accurate temperature monitoring, use a digital data logger (DDL) with a detachable probe that best reflects vaccine temperatures (e.g., probe buffered with glycol, glass beads, sand, or Teflon®). Check and record the temperature daily using a temperature log and one of the options below:

- **Option 1 (preferred): Minimum/Maximum Temperatures**
  Most DDLs display minimum and maximum (min/max) temperatures. Check and record the min/max temperatures at the start of each workday.

- **Option 2: Current Temperature**
  If the DDL does not display min/max temperatures, check and record the current temperature at the start and end of the workday. Review the continuous DDL temperature data daily.

---

*Unpunctured vials may also be stored between 9°C and 25°C (47°F and 77°F) for up to 12 hours.

†Alternate option: A punctured vial may be stored at room temperature (9°C to 25°C [47°F to 77°F]) for up to 2 hours.
