2020–2021 Influenza Season Vaccine Label Examples

Staff can easily confuse different influenza vaccines within the storage unit. Labeling the area or container where vaccines are stored can help staff quickly locate and choose the correct vaccine—perhaps preventing a vaccine administration error. Depending on how vaccines are organized within the storage unit, labels can be placed on the containers or bins or directly attached to the shelves where the vaccines are placed. Other helpful strategies to identify the correct vaccine include color-coding the labels (e.g., one color for pediatric and another for adult vaccines) and providing additional information such as age indications or other information unique to the vaccine.

The following labels are examples that may be used to help organize seasonal influenza vaccines. Labels are based on the manufacturer packaging information as summarized in the recommendations from the Advisory Committee on Immunization Practices (ACIP) for preventing seasonal influenza with vaccines in the 2020–2021 influenza season. Health care personnel should check package and labeling information for the vaccines they have on hand for the most up to date and correct information. The Centers for Disease Control and Prevention (CDC) also recommends that vaccines be stored in the original packaging to protect contents from light, to help maintain the recommended temperature range, and to help prevent administration errors.
