Asthma is a lifelong disease that causes wheezing, breathlessness, chest tightness, and coughing. It can limit a person’s quality of life. While we don’t know why asthma rates are rising, we do know that most people with asthma can control their symptoms and prevent asthma attacks by avoiding asthma triggers and correctly using prescribed medicines, such as inhaled corticosteroids.

The number of people diagnosed with asthma grew by 4.3 million from 2001 to 2009. From 2001 through 2009 asthma rates rose the most among black children, almost a 50% increase. Asthma was linked to 3,447 deaths (about 9 per day) in 2007. Asthma costs in the US grew from about $53 billion in 2002 to about $56 billion in 2007, about a 6% increase. Greater access to medical care is needed for the growing number of people with asthma.

Asthma is increasing every year in the US.

1. Too many people have asthma.
   - The number of people with asthma continues to grow. One in 12 people (about 25 million, or 8% of the population) had asthma in 2009, compared with 1 in 14 (about 20 million, or 7%) in 2001.
   - More than half (53%) of people with asthma had an asthma attack in 2008. More children (57%) than adults (51%) had an attack.
   - About 1 in 10 children (10%) had asthma and 1 in 12 adults (8%) had asthma in 2009. Women were more likely than men and boys more likely than girls to have asthma.
   - About 1 in 9 (11%) non-Hispanic blacks of all ages and about 1 in 6 (17%) of non-Hispanic black children had asthma in 2009, the highest rate among racial/ethnic groups.
   - The greatest rise in asthma rates was among black children (almost a 50% increase) from 2001 through 2009.

2. Asthma has a high cost for individuals and the nation.
   - Asthma cost the US about $3,300 per person with asthma each year from 2002 to 2007 in medical expenses.
   - Medical expenses associated with asthma increased from $48.6 billion in 2002 to $50.1 billion in 2007. About 2 in 5 (40%) uninsured people with asthma could not afford their prescription medicines and about 1 in 9 (11%) insured people with asthma could not afford their prescription medicines.

3. Better asthma education is needed.
   - People with asthma can prevent asthma attacks if they are taught to use inhaled corticosteroids and other prescribed daily long-term control medicines correctly and to avoid asthma triggers. Triggers can include tobacco smoke, mold, outdoor air pollution, and colds and flu.
   - In 2008 less than half of people with asthma reported being taught how to avoid triggers. Almost half (48%) of adults who were taught how to avoid triggers did not follow most of this advice.
   - Doctors and patients can better manage asthma by creating a personal asthma action plan that the patient follows.

Asthma Action Plan

**Green Zone: Doing Well**
No cough, wheeze, chest tightness, or shortness of breath; can do all usual activities. Take prescribed long-term control medicine such as inhaled corticosteroids.

**Yellow Zone: Getting Worse**
Cough, wheeze, chest tightness, or shortness of breath; waking at night; can do some, but not all, usual activities. Add quick-relief medicine.

**Red Zone: Medical Alert!**
Very short of breath; quick-relief medicines don't help; cannot do usual activities; symptoms no better after 24 hours in Yellow Zone. Get medical help NOW.

Who’s at Risk?

Asthma by age and sex US, 2001-2009

- Adult with asthma, US, 2009

- Taught to respond to an asthma attack
- Taught to recognize early signs and symptoms of an asthma attack
- Taught to recognize early signs and symptoms of an asthma attack
- Given a written asthma management action plan

Adults with asthma, US, 2009

What Can Be Done

Federal, state, and local health officials can

◊ Track asthma rates and the effectiveness of control measures so continuous improvements can be made in prevention efforts.

◊ Promote influenza and pneumonia vaccination for people with asthma.

◊ Promote improvements in indoor air quality for people with asthma through measures such as smoke-free air laws and policies, healthy schools and workplaces, and improvements in outdoor air quality.

Health care providers can

◊ Determine the severity of asthma and monitor how much control the patient has over it.

◊ Make an asthma action plan for patients. Use this to teach them how to use inhaled corticosteroids and other prescribed medicines correctly and how to avoid asthma triggers such as tobacco smoke, mold, pet dander, and outdoor air pollution.

◊ Prescribe inhaled corticosteroids for all patients with persistent asthma.

People with asthma and parents of children with asthma can

◊ Receive ongoing appropriate medical care.

◊ Be empowered through education to manage their asthma and asthma attacks.

◊ Avoid asthma triggers at school, work, home, and outdoors. Parents of children with asthma should not smoke, or if they do, smoke only outdoors and not in their cars.

◊ Use inhaled corticosteroids and other prescribed medicines correctly.

Schools and school nurses can

◊ Use student asthma action plans to guide use of inhaled corticosteroids and other prescribed asthma medicines correctly and to avoid asthma triggers.

◊ Make students’ quick-relief inhalers readily available for them to use at school as needed.

◊ Take steps to fix indoor air quality problems like mold and outdoor air quality problems such as idling school buses.

Employers and insurers can

◊ Promote healthy workplaces by reducing or eliminating known asthma triggers.

◊ Promote measures that prevent asthma attacks such as eliminating co-payments for inhaled corticosteroids and other prescribed medicines.

◊ Provide reimbursement for home environmental assessments and educational sessions conducted by clinicians, health educators, and other health professionals both within and outside of the clinical setting.

◊ Provide reimbursement for long-term control medicines, education, and services to reduce asthma triggers that are often not covered by health insurers.
