

1991 NATIONAL SCHOOL-BASED YOUTH RISK BEHAVIOR SURVEY

DATA DOCUMENTATION MANUAL

Introduction

The Youth Risk Behavior Surveillance System (YRBSS) is an epidemiologic surveillance system that was established by the Centers for Disease Control and Prevention (CDC) to monitor the prevalence of youth behaviors that most influence health. The 1991 national school-based Youth Risk Behavior Survey (YRBS) is one component of the YRBSS.

The YRBS focuses on priority health-risk behaviors established during youth that result in the most significant mortality, morbidity, disability, and social problems during both youth and adulthood. These include: behaviors that result in unintentional and intentional injuries; tobacco use; alcohol and other drug use; sexual behaviors that result in HIV infection, other sexually-transmitted diseases (STDs), and unintended pregnancies; dietary behaviors; and physical activity.

Results from the YRBS will be used by CDC to: (1) monitor how priority health-risk behaviors among high school students (grades 9-12) increase, decrease, or remain the same over time; (2) evaluate the impact of broad national, state, and local efforts to prevent priority health-risk behaviors; and (3) monitor progress in achieving relevant national health objectives for the year 2000. Results also will be used to help focus programs and policies for comprehensive school health education on the behaviors that contribute most to the leading causes of mortality and morbidity.

To make the data more widely available, a standardized diskette has been prepared for distribution. This Data Documentation Manual contains a detailed description of the diskette.

Methodology

The 1991 national school-based Youth Risk Behavior Survey (YRBS) used a three-stage cluster sample design to produce a nationally representative sample of 9th through 12th grade students in the United States. The target population consisted of all public and private school students in grades 9 through 12 in the fifty states and the District of Columbia. The first-stage sampling frame included 2,094 primary sampling units (PSUs) consisting of large counties or groups of smaller, adjacent counties. Fifty PSUs were selected from sixteen strata formed on the basis of urbanization and the relative percentage of black and Hispanic students in the PSU. The PSUs were selected with probabilities proportional to school enrollment size. At the second stage of selection, 182 schools were selected with probability proportional to school enrollment size. Schools with substantial numbers of black and Hispanic students were sampled at relatively higher rates than all other schools. The final stage of sampling consisted of randomly selecting within each chosen school at each grade 9 through 12, one or two intact classes of a required subject such as English or social studies. All students in selected classes were eligible to participate.

Survey Procedures

Survey procedures were designed to protect student privacy and allow for anonymous participation. The 75-item questionnaire was administered in the classroom by trained data collectors. Students recorded responses on computer scannable answer sheets. Parental consent was obtained prior to survey administration.

Response Rate

The school response rate was 75 percent and the student response rate was 90 percent. All totaled, 12,272 questionnaires were completed in 137 schools. The overall response rate was 68 percent.

Weighting

A weighting factor was applied to each student record to adjust for nonresponse and the oversampling of black and Hispanic students in the sample. The final, overall weights were scaled so that the weighted count of students per grade was equal to the number of students for that grade in the sample.
