1. Introduction to the YRBSS

The Youth Risk Behavior Surveillance System (YRBSS) is an epidemiologic surveillance system established by the Centers for Disease Control and Prevention (CDC) to monitor the prevalence of youth behaviors that most influence health.

The YRBSS focuses on priority health-risk behaviors established during youth that result in the most significant mortality, morbidity, disability, and social problems during both youth and adulthood. These include: behaviors that result in unintentional and intentional injuries; tobacco use; alcohol and other drug use; sexual behaviors that result in HIV infection, other sexually-transmitted diseases (STDs), and unintended pregnancies; dietary behaviors; and physical activity, plus overweight and asthma.

Results from the YRBSS will be used by CDC to: (1) monitor how priority health-risk behaviors among high school students (grades 9-12) increase, decrease, or remain the same over time; (2) evaluate the impact of broad national, state, and local efforts to prevent priority health-risk behaviors; and (3) monitor progress in achieving relevant national health objectives for the year 2010. Results also will be used to help focus school health programs and policies on the behaviors that contribute most to the leading causes of mortality and morbidity.

The National Youth Risk Behavior Survey (YRBS) uses a three-stage cluster sample design to produce a representative sample of 9th through 12th grade students. The target population consisted of all public, Catholic, and other private school students in grades 9 through 12. A weighting factor was applied to each student record to adjust for nonresponse and the oversampling of black and Hispanic students in the sample. The final, overall weights were scaled so the weighted count of students was equal to the total sample size, and the weighted proportions of students in each grade matched population projections for each survey year. Because of the complexity of the cluster sampling design used, a statistical software package that can calculate sampling variance appropriately must be used. This document provides the information needed to correctly use and analyze the 2005 National YRBS.

2. Response Rate

School Level – All regular public, Catholic, and other private school students, in grades 9 through 12, in the 50 States and the District of Columbia were included in the sampling frame. Puerto Rico, the trust territories, and the Virgin Islands were excluded from the frame. Schools were selected systematically with probability proportional to enrollment in grades 9 through 12 using a random start. Two hundred and three schools were sampled.

Class Level – All classes in a required subject or all classes meeting during a particular period of the day, depending on the school, were included in the sampling frame. Systematic equal probability sampling with a random start was used to select classes from each school that participated in the survey.

Response Rates:

Schools -	78%	159 of the 203 sampled schools participated.
Students -	86%	13,953 of the 16,262 sampled students submitted questionnaires. 13,917 questionnaires were usable after data editing.
Overall response rate -	$78\% * 86\% = 67\%$

3. Data Edits

Describes the procedures used to edit the 2005 National YRBS data to ensure data quality. Editing consists of checking responses for range, height/weight plausibility, and logical consistency.

3.1. Single question edits

If the response to a question does not correspond to one of the possible responses, the response for that question is invalid and is set to missing. This can occur if the only response options for a question are “A” or “B” and the response recorded is “C”, “D”, “E”, “F”, “G”, or “H”, for example.

If more than one response is selected for a question, the response for that question is invalid and is set to missing. The one exception is the race question, which can have multiple responses.

3.2. Height, weight, and body mass index (BMI) Edits

3.2.1. Height/weight edits:

Height is read as a three-column character variable. It is not compressed or justified by the scanning program. The possible responses for the first column range from “3” to “7” and indicate feet; the possible responses for the second and third columns range from “00” to “11” and indicate inches. The height in feet and inches is converted to height in meters using the formula below.

$$\text{Height (in m)} = [(\text{feet} \times 12) + \text{inches}] \times 0.0254 \text{ m/in}$$

If either feet or inches is not filled in or is unreadable, then *Height* is set to missing.

Weight is read as a three-column character variable. It is not compressed or justified by the scanning program. The first column indicates 100s of pounds ranging from “0” to “3”; the second column indicates 10s of pounds and ranges from “0” to “9”; the third column indicates single pounds and ranges from “0” to “9”. The weight in pounds is then converted to weight in kilograms using the following formula:

$$\text{Weight (in kg)} = \text{Weight (in lbs)} \times 0.4536 \text{ kg/lb}$$

If any weight-related column is left blank or is unreadable, all columns are set to missing and *Weight* is set to missing.

Both *Height* and *Weight* are required to calculate the student’s *body mass index (BMI)*. If *Weight* is missing or set to missing, then *Height* is set to missing and if *Height* is missing or set to missing, then *Weight* is set to missing.

3.2.2. BMI edits:

BMI is calculated using *Height* and *Weight* in the following formula:

$$\text{BMI} = \text{kg/m}^2 = \text{Weight (in kg)} / [\text{Height (in m)}]^2$$

If *Height* or *Weight* are missing, BMI is set to missing

If age or sex is missing, *Height*, *Weight*, and BMI are set to missing because the biologically implausible limits (see section 3.2.3) are based on age and sex.

United States High School Survey Data Users Manual

3.2.3. Biologically implausible value edits:

When the basic edits for BMI are complete, further edits are applied to *Height*, *Weight*, and BMI to ensure the results are biologically plausible. *Height*, *Weight*, and BMI are set to missing when an observation lies outside the following limits developed by the Division of Nutrition and Physical Activity, CDC.

Age	Males	Females
≤ 12	Weight: 20.41-136.08 kg Height: 1.02-1.83 m BMI: 11.5-41	Weight: 15.88-136.08 kg Height: 1.02-1.83 m BMI: 11-40
13-14	Weight: 27.22-181.44 kg Height: 1.27-1.98 m BMI: 13-55	Weight: 27.22-181.44 kg Height: 1.27-1.98 m BMI: 13-55
≥ 15	Weight: 31.75-181.44 kg Height: 1.27-2.11 m BMI: 13-55	Weight: 27.22-181.44 kg Height: 1.27-1.98 m BMI: 13-55

3.3. Logical consistency edits

The majority of the edit criteria compare two questions at a time to ensure logical consistency. If responses from two questions conflict logically, both variables are set to blank. (Exception – demographic variables are not set to missing in this case, only the non-demographic variable(s).)

The logical edits used for the 2005 National YRBS questionnaire follow. If the edit criteria are met, data from the questions are changed to missing, unless they are demographic questions.

3.4. Subversion of records

Records are marked “subverted” when there are more than 50 total questions and if a respondent answers 20 or less questions or answers with b, c, d, e, f, g, or h 15 or more times in a row, all values except the demographic variables are set to missing. Subverting records eliminates records judged too incomplete overall to be valid for analysis.

United States High School Survey Data Users Manual

4. Variables

Describes how the race/ethnicity, overweight, risk of overweight, and dichotomous variables were generated from the original survey questions.

4.1. Race/ethnicity calculation

Race/ethnicity for the national 2005 YRBS is computed from the following two questions.

- | | |
|----|---|
| Q4 | Are you Hispanic or Latino? |
| | A. Yes |
| | B. No |
| Q5 | What is your race (Select one or more responses.) |
| | A. American Indian or Alaska Native |
| | B. Asian |
| | C. Black or African American |
| | D. Native Hawaiian or Other Pacific Islander |
| | E. White |

The data for Q4 and Q5 are scanned in as *ethorig* and *raceorig*, respectively. *Ethorig* is a single column variable with either A or B as valid responses. *Raceorig* is a “check all that apply” type question and is scanned into a five-column variable. If the respondent selected “A”, then the first column contains an “A”. If they selected “B”, then the second column contains a “B”, and so on.

To maintain comparability with the 2005 state and local results and the prior years’ results, which used a single question to ascertain race/ethnicity, *ethorig* and *raceorig* are combined to create the six-column *q4_orig* variable. If the value in *ethorig* was “A”, the respondent was classified as Hispanic and a “D” was placed in the fourth column of the *q4_orig* variable. The remaining columns were filled in based on the values for *raceorig*: an “A” is placed in the first column, if the respondent selected “A”; if they selected “B”, then the second column contains a “B”; and if they answered “C”, the third column contains a “C”. To adjust for placing a “D” in the fourth column based on *ethorig*, the remaining answers for *raceorig* (“D” and “E”) were recoded. If the respondent answered “D”, an “E” was placed in the fifth column; and if they selected “E”, an “F” was placed in the sixth column.

Q4_orig is an intermediate processing variable and is used to create the variable *Race* during processing. *Race* is stored as a single column character variable. If the respondent selected only one response option, then *Race* is set as a number between “1” and “6” depending on the option selected. If they selected more than one response and included Hispanic, then *Race* is set to “7” indicating “Multiple – Hispanic”. If they selected more than one response and did not include Hispanic, then *Race* is set to “8” indicating “Multiple – Non-Hispanic”. *Race* is “missing” if they did not select any response, if they left Q4 blank, or if they answered “No” to Q4 without selecting a response for Q5. Please note that 2,212 students completed a state or local YRBS questionnaire instead of the National YRBS questionnaire. The records for these students will have only the *q4_orig* variable as their surveys used only a single question to determine race/ethnicity.

4.2. Percentile, Overweight, and At Risk for Becoming Overweight Calculations

Age (Q1), Sex (Q2), and BMI are used to determine *At Risk for Becoming Overweight* (QNROVWGT) and *Overweight* (QNOVWGT) status. The respondent is considered at risk for becoming overweight, and QNROVWGT is set to “1”, when BMI percentile is at or above the 85th percentile and below the 95th percentile for BMI by age and sex; QNROVWGT is set to “2” otherwise. The respondent is considered overweight, and QNOVWGT is set to “1”, when BMI percentile is at or above the 95th percentile for BMI by age and sex; QNOVWGT is set to “2” otherwise. If BMI is missing, then QNROVWGT and QNOVWGT are set to missing. QNROVWGT and QNOVWGT are mutually exclusive. The BMI percentile for age and sex (BMIPCT), QNROVWGT, and QNOVWGT variables are included in the edited data set.

For the 2005 YRBS, the SAS Program for the CDC Growth Charts has been used to calculate BMI and BMI percentile for age and sex, and generate QNROVWGT and QNOVWGT. This program is posted on CDC’s Division of Nutrition and Physical Activity website (<http://www.cdc.gov/nccdphp/dnpa/growthcharts/sas.htm>) and is available for use by anyone who would like to regenerate the variables. Please note the units required by the SAS program are specified in the documentation available at the website referenced above. YRBS data for height are stored in meters but the program requires height in centimeters.

4.3. Dichotomous variable calculations

There are two types of dichotomous variables - **QN#** and **QNword**. The dichotomous variables present the percent of students answering the predetermined response(s) of interest (ROI). Students answering the ROI(s) are in the numerator. The denominator is either all respondents or a subset of respondents who have indicated they participate in a selected activity or behavior. Students must have provided logically consistent data to be included in any dichotomous variable calculations. Therefore students with missing responses or who had their answers subverted are not included. The variables are created and added to the master dataset during editing.

4.3.1. Summary (QN#) variables:

Each standard question has an accompanying dichotomous variable. The name of the dichotomous variable corresponds to the original question number. For example, the dichotomous variable for Q10 is named QN10. The table below provides the question and response options used for each standard Q# variable and related QN# variable. The bolded responses indicate the ROIs for that question and are also listed in the numerator description. The ROIs are set to “1” for the QN# variables; the remaining responses are set to “2” or to “missing” for the QN# variable. For the subset dichotomous variables, the response that removes the respondent from the denominator is *italicized*. The numerator and denominator are further defined below the responses. Site-added questions and the corresponding QN#s are not included in this document.

4.3.2. Supplemental (QNword) variables:

The **QNword** variables are supplemental, dichotomous variables that are calculated based on results from one or more than one question. How these variables are derived, including which students are used in the numerator and denominator, and the SAS program used are detailed in the following table. The values included in the SAS programs are numbers that correspond to the original responses; 1 = A, 2 = B, etc.

QNFRCIG	<p><u>Numerator:</u> Qnfr cig is based on Q30 and indicates frequent cigarette use. It is “1” when the student reports they smoked on ≥ 20 days during the past 30 days; “2” otherwise. If Q30 is missing, then qnfr cig is missing.</p> <p><u>Denominator:</u> Students who answered A through G.</p> <p><u>Summary Text:</u> Percentage of students who smoked cigarettes on 20 or more of the past 30 days</p> <p><u>SAS:</u> if q30 in ('6','7') then qnfr cig = 1; else if q30 in ('1','2','3','4','5') then qnfr cig = 2;</p>
QNANYTOB	<p><u>Numerator:</u> Qnanytob is based in Q30 (cigarettes), Q36 (smokeless tobacco), and Q38 (cigars). It is “1” if the respondent has used any tobacco during the past 30 days. It is “2” if not. Qnanytob is missing if any of Q30, Q36, or Q38 is missing.</p> <p><u>Denominator:</u> Students who answered A through G for Q30 AND students who answered A through G for Q36 AND students who answered A through G for Q38.</p> <p><u>Summary Text:</u> Percentage of students who smoked cigarettes or cigars or used chewing tobacco, snuff, or dip on one or more of the past 30 days</p> <p><u>SAS:</u> qnanytob = 2; if q30 in ('2','3','4','5','6','7') then qnanytob = 1; if q36 in ('2','3','4','5','6','7') then qnanytob = 1; if q38 in ('2','3','4','5','6','7') then qnanytob = 1; if q30 = '' or q36 = '' or q38 = '' then qnanytob = .;</p>

4.4. Data analysis variables

4.4.1. Weight:

A weight based on student sex, race/ethnicity, and grade level was applied to each record to adjust for school and student nonresponse and oversampling of black and Hispanic students. The overall weights were scaled so that the weighted count of students equals the total sample size, and the weighted proportions of students in each grade match the national population proportions. Thus the data are representative of students in grades 9-12 in public and private schools in the United States. "WEIGHT" indicates the weight factor assigned to each student record.

4.4.2. Stratum:

The sample design employed a three-stage cluster sample stratified by racial/ethnic concentration and MSA status. "STRATUM" indicates the stratum the school the student attends was assigned to.

4.4.3. Primary sampling unit (PSU):

PSUs consist of counties, groups of smaller adjacent counties, or sub-areas of very large counties. "PSU" indicates the PSU the school the student attends was assigned to.

5. Software requirements

The YRBS uses a multi-stage cluster sample design. Statistical software used to analyze YRBS data should account for this design. Many packages with this capability are available. A small sample of software packages and procedures that can account for the clustered design is presented below:

Software Package	Procedures
SAS	proc surveyfreq, proc surveymeans, and others
SPSS	csdescriptives, cstabulate, and others
SUDAAN	proc descript, proc crosstab, and others
Epi Info	complex sample frequencies, complex sample tables, and others

For information on how to use a specific software package, please consult the software documentation.
