Prevention of Sexually Transmitted Zika, Zika Action Plan (ZAP) Post-Summit Teleconference

John T. Brooks, MD
Senior Medical Advisor
National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention
Centers for Disease Control and Prevention

June 2, 2016
Objectives

- Review what is known and what is not known about the sexual transmission of Zika virus
- Describe CDC activities, materials, and resources available for clinicians, health departments, and consumers
- Identify what state and local programs can do to reduce the risk of sexual transmission of Zika
Transmission of Zika virus

Documented

- Bite of an *Aedes aegypti* or *Ae. albopictus* mosquito
- Intrauterine and perinatal transmission
- Sexual transmission from infected men

Plausible

- Blood transfusion/tissue transplantation
- Breast milk
- Laboratory exposure
Aedes aegypti mosquitoes are more likely to spread viruses like Zika, dengue, chikungunya than other types of mosquitoes such as Aedes albopictus mosquitoes.

- These maps show CDC’s best estimate of the potential range of Aedes aegypti and Aedes albopictus in the United States.
- These maps include areas where mosquitoes are or have been found.
- Shaded areas on the maps do not necessarily mean that there are infected mosquitoes in that area.

*Maps have been updated from a variety of sources. These maps represent CDC’s best estimate of the potential range of Aedes aegypti and Aedes albopictus in the United States. Maps are not meant to represent risk for spread of disease.

Populations of Greatest Concern

- Pregnant women
  - Infection at conception or during pregnancy\(^1\)
  - Microcephaly and other severe fetal brain defects\(^1\)
- Women of reproductive age (age 15-44 years)
  - 37% of pregnancies in the US are unplanned\(^2\)

## What we know and what we don’t know

Kachur, MPH\textsuperscript{3}; Emily E. Petersen, MD\textsuperscript{4}; Denise J. Jamieson, MD\textsuperscript{4}; Amanda C. Cohn, MD\textsuperscript{5}; John T. Brooks, MD\textsuperscript{1}

On March 25, 2016, this report was posted as an MMWR Early Release on the MMWR website (http://www.cdc.gov/mmwr). CDC issued interim guidance for the prevention of sexual transmission of Zika virus on February 5, 2016 (1). The following recommendations apply to men who have traveled to or reside in areas with active Zika virus transmission* and their female or male sex partners. These recommendations replace the previously issued recommendations and are updated to onset; RT-PCR of blood at that time was negative (7). Because serial semen specimens were not collected for these three cases, the duration of persistence of infectious Zika virus in semen remains unknown.

All reported cases of sexual transmission involved vaginal or anal sex with men during, shortly before onset of, or shortly after resolution of symptomatic illness consistent with Zika virus disease. It is not known whether infected men who never
Recommendations: Risk Groups Addressed

- Pregnant women and their male partners
- Other concerned couples
  - Couples trying to conceive
  - Couple not trying to conceive
Recommendations: Pregnant Women and Their Male Partners

- Applies to couples in which a man has traveled to or resides in an area with active Zika virus transmission

- Couples in which a woman is pregnant
  - Use condoms consistently and correctly or abstain from sex for the duration of the pregnancy.
  - Sex includes vaginal, anal, and oral (mouth-to-penis) sex.

- This recommendation is our strongest recommendation and does not change based on whether the woman lives in a Zika affected area, has a male partner who travels to or lives in a Zika affected area, whether the male partner has symptoms or if he tests positive/negative for Zika.
**Recommendations: Couples Trying to Conceive**

http://www.cdc.gov/mmwr/volumes/65/wr/mm6512e3.htm?s_cid=mm6512e3_w
Recommendations: Time Frames

- CDC applied a conservative approach recognizing:
  - Exact incubation period of Zika unknown
  - Duration of Zika persistence in semen not fully known
  - Some couples are seeking to achieve conception

- **8 weeks**: For situation where persistence not known to be a concern
  - Took upper limit of the incubation period of 14 days
  - Added 3 times the longest published period of viremia (3 x 11 days)
  - Additional time for variability of individuals’ immune system.

- **6 months**: For situation where persistence known to be a concern
  - Multiplied by 3 the longest documented persistence of detectable Zika virus RNA particles in the semen (62 days)
Testing

- Recommended to establish diagnosis of infection
- Who?
  - Persons with Zika symptoms
  - Pregnant women (symptomatic or asymptomatic)
- Under what circumstances
  - Traveled to or lives in areas with Zika
  - Had sex with a man who has been in areas with Zika (exception: no testing if neither person has symptoms)
Testing

- NOT recommended to establish *risk of sexual transmission in men* until we know more about Zika shedding in semen
- Negative results might be *falsely reassuring* since Zika can persist in semen after it’s no longer detectable by RT-PCR in blood
- A negative serum IgM might represent
  - Falsely negative test
  - Tested before IgM developed or after than waned
- A negative semen test (RT-PCR or culture) might represent intermittent shedding
  - RT-PCR testing of semen not validated
Sperm and Oocyte Donation

- Sperm and egg donation regulated by FDA
- FDA guidance in place to prevent Zika transmission from gametes
- Directed donations may not be covered by FDA guidance in some circumstances
- Incumbent on providers to review risk/benefit with patients
- If concerned:
  - Contact entity providing sperm or oocytes and inquire about policies
  - For directed donation, consider risk of Zika for donor (e.g., travel history, symptoms) to make informed choice
  - Wait
- Testing of egg and sperm donors *not recommended* at present because of possibility of falsely reassuring negative results
Challenges

Talking about the sexual transmission of Zika virus can be complicated

- Clear and unambiguous instructions
  - If concerned about Zika, couples can use condoms or choose not to have sex
    - *Highly* recommended during pregnancy
  - To be effective, condoms must be used correctly from start to finish, every time during sex
  - Sex includes vaginal, anal and oral (mouth-to-penis) sex

- Couples who do not desire pregnancy should use the most effective contraceptive methods that can be used correctly and consistently *in addition to* condoms, which can prevent transmission of Zika and are also effective against STDs
Challenges

Condom skills

- Practice makes (almost always...) perfect.
- Use proper lubricant (water- and silicone-based, not oil-based).

Availability and access to condoms

- There may be barriers to accessing and using condoms including availability, price, and a person’s ability to convince their partner to use condoms.

Social norms and religious beliefs

- Religious and cultural beliefs may restrict a person’s ability to use condoms or other contraception.
What is CDC Doing to Better Understand Shedding of Zika Virus in Semen and Other Body Fluids?

1. U.S. study of returned male travelers diagnosed with Zika
   - Semen and urine testing
   - Every 2 weeks up to 6 months after onset
   - Self-collection, self-mailer
   - Project Director: Alison Hinckley, cue0@cdc.gov/970-221-6400

2. Puerto Rico study of men and women diagnosed with Zika (ZIPER)
   - Blood, saliva, urine, semen, and vaginal secretions testing every 2 weeks
   - Symptomatic and asymptomatic men and women
   - Specimens weekly for 4 weeks then biweekly until negative twice
   - Recruiting 350 patients with up to 5 household contacts each
   - Email ZIPER@cdc.gov
What is CDC Doing to Better Understand Shedding of Zika Virus in Semen and Other Body Fluids?

- Case reports matter!
  - Please report all suspect cases to state or local health department
  - Timely reporting increases opportunity to:
    - Collect relevant samples among willing male volunteers.
    - Manage changes in recommendations faster, if indicated.
What You Can Do?

- Communicate about sexual risk and how to prevent sexual transmission of Zika.
- Make condoms available and accessible.
  - Assess potential demand and current stock.
  - Prepare plan to acquire, distribute, and promote if they are needed.
- Provide resources and information for pregnancy prevention.
- Refer cases of infected men for US viral persistence study.
