INITIAL EVALUATION AND OUTPATIENT MANAGEMENT
DURING THE FIRST 12 MONTHS OF LIFE FOR INFANTS WITH POSSIBLE CONGENITAL ZIKA VIRUS INFECTION

Ask about possible maternal and congenital Zika virus exposure

---

**Initial Evaluation**

**Before hospital discharge**
- □ Routine newborn care: physical exam, including head circumference, weight, length and neuro exam
- □ Head ultrasound
- □ Infant testing for congenital Zika virus infection (See Table 1)

(See Page 3, Checklist 1)

---

Does mother have lab evidence of Zika virus infection?

**YES**

**NO**

- □ Does infant have abnormalities consistent with congenital Zika syndrome?

---

**MOTHER NOT TESTED, OR TESTED OUTSIDE OF APPROPRIATE WINDOW**

**YES**

**NO**

- □ Does infant have abnormalities consistent with congenital Zika syndrome?

---

**Follow management and follow-up recommendations indicated in Outpatient Management Checklist**

August 23, 2017

- □Routine preventive health care including monitoring of feeding and growth
- □Routine and congenital infection-specific anticipatory guidance
- □Referral to specialists, including evaluation of other causes of congenital anomalies as needed
- □Referral to early intervention services

(See Page 3, Checklist 2)

**Row 2**

- □Continue to evaluate for other causes of congenital anomalies
- □Further management as clinically indicated

**Row 3**

- □Ophthalmology exam
- □ABR

- □Consider repeat ABR
- □Behavioral audiology evaluation if ABR not done at 4-6 months

- □Monitoring of growth parameters (HC, weight, and height), developmental monitoring by caregivers and healthcare providers, and age-appropriate developmental screening at well-child visits

(See Page 3, Checklist 3)

**Row 4**

- □Monitoring of growth parameters (HC, weight, and height), developmental monitoring by caregivers and healthcare providers, and age-appropriate developmental screening at well-child visits

---

**Abbreviations:**

- rRT-PCR = real-time reverse transcription–polymerase chain reaction; IgM = immunoglobulin M; CBC = complete blood count; LFTs = liver function tests; PE = physical examination; US = ultrasound; ABR = auditory brainstem response; CT = computed tomography; MRI = magnetic resonance imaging; neuro = neurologic; HC = Head (occipitofrontal) circumference

- Zika virus exposure includes travel to or residence in an area with risk of Zika or unprotected sex with a partner who traveled to or resided in an area with risk of Zika.

- Laboratory evidence of Zika virus infection includes: (1) Zika virus RNA detected by real-time reverse transcription-polymerase chain reaction (rRT-PCR) in any clinical specimen; or (2) positive Zika virus IgM. Confirmatory neutralizing antibody titers are needed in addition to IgM for maternal Zika virus infection. Cord blood and testing of the placenta not recommended for infant testing for Zika virus.

- Mothers with Zika virus exposure who had an infant with Zika-associated birth defects should be tested by nucleic acid testing (NAT), and IgM as soon as possible within 12 weeks after symptom onset or possible exposure. Because of the decline in IgM antibody over time, negative maternal testing more than 12 weeks after exposure or symptom onset does not rule out maternal infection.

- Findings consistent with congenital Zika virus syndrome can include microcephaly, intracranial calcifications, or other brain or eye abnormalities.

- Infant testing is recommended within the first two days after birth. If specimens are collected later, it may be difficult to distinguish congenital from postnatally acquired infection in areas with risk of Zika; however, testing specimens collected in the first few weeks to months after birth may still be useful in the evaluation for possible congenital Zika virus infection, especially among infants born in areas without risk of Zika.

- Outpatient management checklist for infants born to a woman with laboratory evidence of confirmed or possible Zika virus infection.

**Abbreviations:** rRT-PCR = real-time reverse transcription-polymerase chain reaction; IgM = Immunoglobulin M

* Infant serum, urine or cerebrospinal fluid.

† Laboratory results should be interpreted in the context of timing of infection during pregnancy, maternal serology results, clinical findings consistent with congenital Zika syndrome, and any confirmatory testing with plaque reduction neutralization testing (PRNT).

**CHECKLIST 1**

**Initial clinical evaluation & management of infants with laboratory evidence of Zika virus infection and abnormalities consistent with congenital Zika syndrome†**

**Consultation with:**
- Neurologist for determination of appropriate neuroimaging and additional evaluation.
- Infectious disease specialist for diagnostic evaluation of other congenital infections (e.g., syphilis, toxoplasmosis, rubella, cytomegalovirus infection, lymphocytic choriomeningitis virus infection, and herpes simplex virus infection).
- Ophthalmologist for comprehensive eye exam and evaluation for possible cortical visual impairment prior to discharge from hospital or within 1 month of birth.
- Endocrinologist for evaluation for hypothalamic or pituitary dysfunction.
- Clinical geneticist to evaluate for other causes of microcephaly or other anomalies if present.

**Consider consultation with:**
- Orthopedist, physiatrist, and physical therapist for the management of hypertonia, club foot or arthrogrypotic-like conditions.
- Pulmonologist or otolaryngologist for concerns about aspiration.
- Lactation specialist, nutritionist, gastroenterologist, or speech or occupational therapist for the management of feeding issues.
- Perform ABR to assess hearing.
- Perform complete blood count and metabolic panel, including liver function tests.
- Provide family and supportive services.

**CHECKLIST 2**

**Outpatient management of infants with laboratory evidence of Zika virus infection and abnormalities consistent with congenital Zika syndrome†**

- A medical home should be established, and visits with primary care provider should occur monthly for at least the first 6 months of life.
- Follow growth parameters, monitor development, encourage parents and other caregivers to monitor child’s development, provide routine immunizations and anticipatory guidance, psychosocial support, and to ensure infants receive necessary testing and consultations.
- Neurologic examination by the primary care provider at 1 and 2 months of age. Refer to neurology for any abnormalities, or for any parental or provider concerns.
- Refer to developmental specialist and early intervention services.
- Repeat a comprehensive ophthalmologic exam at 3 months of age, and refer to ophthalmology for any abnormal findings, or for any parental or provider concerns.
- Repeat ABR testing at 4-6 months of age, and follow up on any abnormal findings, or for any parental or provider concerns.
- Repeat testing for hypothyroidism (i.e., TSH, total T4 and estimated free T4) at 2 weeks and 3 months of age, even if the initial testing was normal. Refer to endocrinology for any abnormal findings.
- Provide family and supportive services.

**CHECKLIST 3**

**Outpatient management of infants with laboratory evidence of Zika virus infection, but without abnormalities consistent with congenital Zika syndrome†**

- A medical home should be established.
- Follow growth parameters, perform developmental monitoring at each well child visit and encourage parents and other caregivers to monitor child’s development.
- Emphasize anticipatory guidance for families regarding developmental milestones, feeding and growth, sleep and irritability, and abnormal movements.
- Use a standardized, validated developmental screening tool at 9 months as currently recommended, or earlier for any parental or provider concerns.
- Referral to ophthalmology for comprehensive eye exam within one month of birth. Perform vision screening and assess visual regard at every well child visit, and refer to ophthalmology for any abnormal findings, or for any parental or provider concerns.
- Perform ABR within one month of birth. Perform behavioral diagnostic testing at 9 months of age, or consider repeat ABR at 4-6 months. Refer to audiology for any abnormal findings, or for any parental or provider concerns.
- Provide family and supportive services.
