

On July 24, 2017, CDC released updated interim guidance for the care of pregnant women with possible Zika virus exposure. Following the release of this updated guidance, this tool no longer reflects current recommendations for infant Zika virus testing, clinical evaluation, follow-up care, and placental and fetal tissue Zika virus testing. CDC will be updating its webpages in the near future to reflect the implications of the updated guidance on care of infants with possible congenital Zika virus exposure.

- For the latest information on evaluation, testing, and follow-up care of infants with possible congenital Zika virus infection, visit [Healthcare Providers Caring for Infants & Children](#).
- For updated information on placental and fetal tissue Zika virus testing, see Table 2 of [Update: Interim Guidance for Healthcare Providers Caring for Pregnant Women with Possible Zika Virus Exposure—United States, June 2017](#).
