The Importance of Pregnancy Planning in Areas with Active Zika Transmission

Dana Meaney Delman, MD
Clinical Team Lead, Pregnancy and Birth Defects Task Force
CDC’s 2016 Zika Virus Response

Post ZAP Summit Webinar
June 2, 2016
2:00-3:00 PM (EST)
Pregnancy Planning and Access to Contraception

- Primary strategy to reduce Zika-related pregnancy complications is to prevent pregnancy in women who want to delay or avoid pregnancy.
- Healthcare providers should
  - Discuss prevention of unintended pregnancy with women and couples who live in areas with local Zika transmission and who want to delay or avoid becoming pregnant
  - Provide information about birth control methods that best meet their needs (including long-acting reversible contraceptives)
CDC Recommendations

Morbidity and Mortality Weekly Report

Update: Interim Guidance for Health Care Providers Caring for Women of Reproductive Age with Possible Zika Virus Exposure — United States, 2016

Emily E. Petersen, MD1; Kara N. D. Polen, MPH2; Dana Meaney-Delman, MD3; Sascha R. Ellington, MSPH1; Titilope Oduyebo, MD1,4; Amanda Cohn, MD5; Alexandra M. Oster, MD6; Kate Russell, MD6,7; Jennifer F. Kawwass, MD1,8; Mateusz P. Karwowski, MD4,9; Ann M. Powers, PhD10; Jeanne Bertolli, PhD6; John T. Brooks, MD6; Dmitry Kissin, MD1; Julie Villanueva, PhD11; Jorge Muñoz-Jordan, PhD10; Matthew Kuehnert, MD12; Christine K. Olson, MD1; Margaret A. Honein, PhD2; Maria Rivera, MPH1; Denise J. Jamieson, MD1; Sonja A. Rasmussen, MD13

On March 25, 2016, this report was posted as an MMWR Early Release on the MMWR website (http://www.cdc.gov/mmwr).

CDC has updated its interim guidance for U.S. health care providers caring for women of reproductive age with possible Zika virus exposure (1) to include recommendations on coun-
partners (3,5,7–10). Based on data from a previous outbreak, most persons infected with Zika virus are asymptomatic (11). Signs and symptoms, when present, are typically mild, with the most common being acute onset of fever, macular or papular rash, arthralgia, and conjunctivitis (11).
**CDC Recommendations:**

Considerations for Couples Interested in Conceiving Living in an Area With Active Zika Virus Transmission

- Reproductive life plan
- Environmental risk of exposure
- Personal measures to prevent mosquito bites
- Personal measures to prevent sexual transmission
- Education about Zika virus infection during pregnancy
- Risks and benefits of pregnancy at this time
Clinical Tool

**PRECONCEPTION COUNSELING**

For Women and Men Living in Areas with Ongoing Spread of Zika Virus Who Are Interested in Conceiving

This guide describes recommendations for counseling women and men living in areas with Zika who want to become pregnant and have not experienced clinical illness consistent with Zika virus disease. This material includes recommendations from CDC's updated guidance, key questions to ask patients, and sample scripts for discussing recommendations and preconception issues. Because a lot of content is outlined for discussion, questions are included throughout the sample script to make sure patients understand what they are being told.

**Knowledge check:** What are some ways to protect yourself at home and work?
Recommendations for Couples Interested in Conceiving Living in an Area With Active Zika Virus Transmission

- If couples decide to attempt conception:
  - Prevent mosquito bites through
    - Use of EPA-registered insect repellent during pregnancy
    - Wearing long-sleeves/pants
    - Removing standing water,
    - Staying in rooms with screens on windows/doors
    - Staying and sleeping in air-conditioned rooms or under bed nets
  - After successful conception, prevent sexual transmission through correct and consistent use of condoms or abstaining from sex for duration of pregnancy
Recommendations for Couples Interested in Conceiving Living in an Area With Active Zika Transmission & recent Zika disease

- If one or both members of the couple have Zika virus disease:
  - Recommend waiting to attempt conception
    - For at least 8 weeks for women who have Zika virus disease
    - For at least 6 months for men who have Zika virus disease
Recommendations for Couples Interested in Conceiving
Living in an Area With Active Zika Transmission & Waiting to Conceive

- If couples decide to wait to conceive, healthcare providers should discuss
  - Strategies to prevent unintended pregnancy
  - Use of the most effective contraceptive methods that can be used correctly and consistently
  - Role of correct and consistent use of condoms in reducing the risk for sexually transmitted infections, including Zika
Most Effective Family Planning Methods

**REVERSIBLE**

- **Injectable**: 6% pregnancies per 100 women in a year
- **Pill**: 9% pregnancies per 100 women in a year
- **Patch**: 9% pregnancies per 100 women in a year
- **Ring**: 9% pregnancies per 100 women in a year
- **Diaphragm**: 12% pregnancies per 100 women in a year

**PERMANENT STERILIZATION**

- **Female (Abdominal, Laparoscopic, and Hysteroscopic)**: 0.5% pregnancies per 100 women in a year
- **Male (Vasectomy)**: 0.15% pregnancies per 100 women in a year

**LEAST EFFECTIVE**

- **Implant**: 0.05% pregnancies per 100 women in a year
- **Intrauterine Device (IUD)**: 0.2% LNG, 0.8% Copper T

*Other Methods of Contraception: (1) Lactational Amenorrhea Method (LAM): is a highly effective, temporary method of contraception; and (2) Emergency Contraception: emergency contraception pills or a copper IUD after unprotected intercourse substantially reduces risk of pregnancy.*

Effective Family Planning Methods

Most Effective

- Implant: 0.05%
- Intrauterine Device (IUD)
  - LG: 0.2%
  - Copper T: 0.8%

Permanent Sterilization

- Female (Abdominal, Laparoscopic, and Hysteroscopic): 0.5%
- Male (Vasectomy): 0.15%

Reversible

- Injectable: 6%
- Pill: 9%
- Patch: 9%
- Ring: 9%
- Diaphragm: 12%

- Male Condom: 18%
- Female Condom: 21%

Condoms should always be used to reduce the risk of sexually transmitted infections.

Fertility Awareness-Based Methods

- Abstain or use condoms on fertile days.

- Spermicidal: 28%

Other Methods of Contraception:

2. Emergency Contraception: Emergency contraceptives pills or a copper IUD can prevent unintended pregnancy and substantially reduce risk of pregnancy.

Contraceptive Access in the US
Unintended Pregnancy in the US

Unintended pregnancy is common in many states potentially impacted by Zika

Contraceptive Access in the United States

- 61 million women in the US between 15-44 years\(^1\)
  - 43 million are at risk for unintended pregnancy\(^2\)
    - \(~62\%\) currently use a contraceptive method
      - 10.5\% are currently using a LARC (IUD or implant)
    - 10\% of women at risk of unintended pregnancy not currently using any contraceptive method

Contraceptive Method Choice Among US Women, 2011-2013

- Most common contraceptive methods used were
  - Pill (25.9%)
  - Female sterilization (25.1%)
  - Male condoms (15.3%)
  - Long-acting reversible contraceptives (10.3%)
  - Male sterilization (8.2%)
Unmet Contraceptive Need in the US

- 20.1 million women at risk for unintended pregnancy were in need of publicly funded contraceptive services
  - Either had an income <250% of Federal poverty level OR
  - Were <20 years of age
- Of these, 5.6 million (28%) did not have health insurance
- Publicly funded providers met approximately 42% of the need

Many US women at risk for unintended pregnancy

State Women’s Health Factsheets: https://www.cdc.gov/reproductivehealth/data_stats/state-profiles.htm

Includes information on HHS Unintended Pregnancy Activities (as of 2016)

- 6/18 initiative
- ASTHO LARC Learning Community
- CoIIN Pre/Interconception Care
- CMCS MIH Initiative
HHS Unintended Pregnancy Activities in States

- **6/18 initiative:** Partnership between CDC, healthcare purchasers, payers, and providers to accelerate adoption of evidence-based prevention interventions
  - Targets adoption of 18 proven interventions for 6 common and costly health conditions including unintended pregnancies.
  - For more information, see [http://www.cdc.gov/sixeighteen/](http://www.cdc.gov/sixeighteen/)

- **CDC/ASTHO Immediate Post-partum LARC Learning Community:** Collaboration with states to assist state health agencies in implementing Long-Acting Reversible Contraceptives (LARC)
  - For more information, see [http://www.astho.org/Programs/Maternal-and-Child-Health/Long-Acting-Reversible-Contraception-LARC/](http://www.astho.org/Programs/Maternal-and-Child-Health/Long-Acting-Reversible-Contraception-LARC/)
HHS Unintended Pregnancy Activities in States

- Collaborative Improvement & Innovation Network to Reduce Infant Mortality (CoIIN) Pre/Interconception Care:
  - National effort to reduce infant mortality
  - Key strategy to improve preconception/interconception care, which includes the delivery of contraceptive services to prevent teen and unintended pregnancy and improve birth spacing
  - For more information, see: http://mchb.hrsa.gov/infantmortality/coiin/
HHS Unintended Pregnancy Activities in States

The Centers for Medicaid and CHIP Services (CMCS), Maternal and Infant Health (MIH) Initiative:

- Promotes timely and comprehensive postpartum care, including promotion of pregnancy planning and spacing, and prevention of unintended pregnancies through increased use of effective contraception.

- For more information, see https://www.medicaid.gov/Medicaid-CHIP-Program-Information/By-Topics/Quality-of-Care/Downloads/Maternal-and-Infant-Health-Initiative.pdf
What CDC is doing
Assessing Access to Contraception in the US

- Analyzing data from Pregnancy Risk Assessment Monitoring System (PRAMS)
  - Surveillance project of CDC and state health departments
  - Collects state-specific, population-based data on maternal attitudes and experiences before, during, and shortly after pregnancy
  - Covers 78% of all US births
  - Assesses unintended pregnancy and postpartum contraceptive use

- Planning comprehensive assessment of contraceptive access and unintended pregnancy in states and territories
Improving Access to Contraception in Continental US

- CDC is actively collaborating with HHS agencies to remove barriers and increase contraceptive access for women who want to delay or avoid pregnancy during Zika
  - HHS strategy for expanded training of clinical providers on contraceptive service delivery
  - Office of Population Affairs’ Title X Family planning program
  - HRSA Bureau of Primary Care
  - HRSA Maternal and Child Health Bureau
  - The Center for Medicare & Medicaid Innovation (CMMI)
Access to Contraception in Continental US

- CDC encourages state Medicaid programs to
  - Implement the LARC payment strategies
  - Strengthen the capacity of providers to deliver contraceptive services

www.cdc.gov/sixeighteen/
What you could do
Prior to local transmission

- Educate providers about the importance of discussing contraception with women and couples who live in areas with local Zika transmission and who want to delay or avoid becoming pregnant
- Assess availability of contraceptive access for women of reproductive age in your jurisdiction who wish to avoid or delay pregnancy during a local Zika outbreak
- Identify geographic areas or vulnerable populations who may not have access to contraceptive services
Once local transmission has occurred

- Inform providers about the importance of discussing contraception with women and couples who live in areas with local Zika transmission and who want to delay or avoid becoming pregnant
- Recommend that providers ensure that couples who want to delay or avoid pregnancy are informed about birth control methods that best meet their needs, including long-acting reversible contraceptives (IUDs, implants)
- Develop plans to provide contraceptive access for underserved populations
