# Preconception Counseling

For Women and Men Living in Areas with a CDC Zika Travel Notice Who Are Interested in Conceiving

This guide describes recommendations for counseling women and men living in areas with a CDC Zika travel notice, as well as those who frequently travel to such an area, who want to become pregnant and have not experienced clinical illness consistent with Zika virus disease. This material includes recommendations from CDC’s updated guidance, key questions to ask patients, and sample scripts for discussing recommendations and preconception issues. Because a lot of content is outlined for discussion, questions are included throughout the sample script to make sure patients understand what they are being told.

<tbody>
<tr>
<td><strong>Assess pregnancy intentions</strong></td>
<td>Introduce importance of pregnancy planning</td>
<td>Have you been thinking about having a baby? Would you like to become pregnant in the next year? Are you currently using any form of birth control?</td>
<td>If you are thinking of having a baby, I would like to help you have a healthy and safe pregnancy. With continued local mosquito-borne spread of Zika virus, pregnancy planning is more important than ever. Preparing and planning for a healthy pregnancy means getting as healthy as you can before becoming pregnant, and also taking the time now to learn about how best to care for yourself during pregnancy.</td>
</tr>
<tr>
<td><strong>Discuss risk of Zika</strong></td>
<td>Possible adverse outcomes of Zika virus infection during pregnancy</td>
<td>Have you heard about Zika? Do you know the risks of getting Zika during pregnancy? Do you know why it’s so important for you to prevent mosquito bites and protect yourself during sex?</td>
<td>For pregnant women, the concern is that Zika virus can be passed to the fetus during pregnancy or around the time of birth. Infection with Zika virus during pregnancy can cause a birth defect called microcephaly and other problems with brain development. Children with microcephaly often have serious problems with development and can have other neurologic problems, such as seizures. Other problems seen in pregnancies with Zika virus are miscarriage, stillbirth, and a spectrum of other poor health outcomes in babies, including problems with vision, hearing loss, and impaired growth. This is why it’s so important to protect yourself during your pregnancy.</td>
</tr>
<tr>
<td><strong>Assess risk of Zika virus exposure</strong></td>
<td>Environment</td>
<td>Do you have air conditioning in your home? At work? Do you have window and door screens in your home? At work? Do you have a bed net? Would you consider using one? Do you live in an area with a lot of mosquitoes?</td>
<td>The best way to prevent Zika is to prevent mosquito bites. To protect yourself at home and work, use air conditioning if possible. Install window and door screens and repair any holes to help keep mosquitoes outside. Sleep under a bed net, if air conditioning or screened rooms are not available. Since you live in an area where Zika is spreading, you are at risk of getting Zika. It is important that we discuss the timing of your pregnancy, and ways to prevent infection when you are pregnant.</td>
</tr>
<tr>
<td><strong>Personal measures to prevent mosquito bites</strong></td>
<td>Are you willing to wear clothes that cover your skin, like long pants and long-sleeved shirts? Do you dip or spray your clothes with permethrin or wear permethrin-treated clothing (specially treated clothing to keep mosquitoes away)? Do you use insect repellents throughout the day and night? How often do you reapply? Are you following the directions on the label? Do you have standing water near or around your home or workplace? Do you empty standing water you find near your home?</td>
<td>Now and throughout your pregnancy, you and your partner should take important steps to protect yourselves from getting Zika. Wearing long-sleeved shirts and long pants protects your arms and legs. Treating clothing with permethrin adds another layer of protection, just don’t put permethrin directly on your skin. Use EPA-registered insect repellents with one of the following active ingredients: DEET, picaridin, IR3535, oil of lemon eucalyptus or 2-undecanone. These insect repellents are safe to use during pregnancy. Always follow the product label instructions and use as directed. This includes reapplying throughout the day as directed on the product label instructions. Help reduce the number of mosquitoes around your home by emptying standing water from items like flowerpots, gutters, buckets, pool covers, pet water dishes, discarded tires, and bird baths on a regular basis.</td>
<td></td>
</tr>
<tr>
<td><strong>Personal measures to prevent sexual transmission</strong></td>
<td>After you become pregnant, are you and your partner willing to either use condoms or not have sex for the duration of your pregnancy?</td>
<td>Zika virus can also be transmitted through sexual contact. Your partner might be bitten by a mosquito and become infected with Zika, and then he could infect you. Most people who get infected with Zika virus don’t get sick, so your partner might not have any symptoms of Zika. While you’re trying to get pregnant, it’s important to protect yourselves from mosquito bites. Once you know you’re pregnant, you and your partner should use a condom the right way, every time you have vaginal, anal, or oral (mouth-to-genital) sex or you should not have sex while you are pregnant.</td>
<td></td>
</tr>
</tbody>
</table>

| Discuss Zika virus infection in pregnancy  | Signs and symptoms of Zika virus disease       | Do you know the signs and symptoms of Zika?  
Do you know when to see the doctor or other healthcare provider if you think you may be infected? | Most people with Zika won’t know they have it. But for those that do get symptoms, they usually get a mild illness with fever, rash, joint pain or red eyes. The illness usually lasts about a week. If you get sick with symptoms and you’re pregnant, you should see a healthcare provider for testing right away. Since you live in an area with Zika, you may be offered testing before and during pregnancy.  
**Knowledge check:** What are the signs and symptoms of Zika? What should you do if you think you may be infected? |
| Testing considerations in the preconception period | Have you been tested for Zika before?          |                                                                                   | Because we live in an area where local mosquitoes continue to spread Zika, you may have been previously infected and already developed antibodies against Zika. Antibodies are proteins that your body makes to fight infections, and they can stay in your body for different amounts of time. Tests looking for antibodies against Zika may not tell us if you were infected in the past or if you were infected recently. We can consider antibody testing now because you are thinking about becoming pregnant. If you get pregnant in the future, we can use those results to help interpret future test results. If you are negative now, and become positive during pregnancy, we will have evidence that it is likely a recent infection. However, there are also some drawbacks to testing you before pregnancy. We cannot use any test results to decide whether or not you should become pregnant because the test results could mean many things. It’s not a way to decide if it’s “safe” to become pregnant. If you are positive for antibodies against Zika virus, it could mean you have a recent infection with Zika, a past infection with Zika, recent infection with a similar type of virus, like dengue, or a false positive, meaning the test shows you have Zika when you weren’t actually infected. Test results represent a moment in time. Because Zika continues to be a risk here, a negative test result means that you may still be at risk for getting Zika in the future. This is why it’s important to take steps to protect yourself from Zika. |
| Explore reproductive life plan              | Unknown duration of the outbreak               |                                                                                   | There is still a lot we don’t know about Zika. We don’t know how long local mosquitoes will be spreading Zika, so it’s really important that you keep protecting yourself throughout the pregnancy. Scientists are working to make a vaccine to protect people from Zika. |
| Discuss risks & benefits of pregnancy at this time with woman & partner | Talk about importance of thinking about and developing a plan | How old are you?  
Have you been pregnant or had children before?  
How old do you want to be when you start and stop having children? How many children do you want?  
How does pregnancy fit in to your life right now (e.g., school, work)?  
For more questions to consider, see [http://www.cdc.gov/preconception/documents/reproductivelifeplan-worksheet.pdf](http://www.cdc.gov/preconception/documents/reproductivelifeplan-worksheet.pdf) | There are many factors to consider when deciding to get pregnant. I would like to help you reach your goals for building a family. This includes helping you avoid pregnancy when you do not want to be pregnant and helping you have a safe, uncomplicated pregnancy when you are ready to have children. |
| Discuss risks & benefits of pregnancy at this time with woman & partner | What are your thoughts about what we’ve discussed?  
Do you have any questions?  
Is there any more information you need right now to help with choices or family planning? |                                                                                   | Given the risks of Zika to pregnant women and infants, we need to consider if now is the right time for you to get pregnant. This is a very personal decision. I want you to know that I’m here to help you and answer your questions. We can also talk about this more if you have further questions or if new information about Zika becomes available. |
| If pregnancy is not desired now, discuss contraceptive options | Contraception                                  | Are you currently using birth control?  
What type of birth control do you prefer to use? | If you decide that now isn’t the right time for you to have a baby, I can help you find the birth control for you that is safe, effective, and works for you and your life. Let’s work together to find the most effective option for you and your partner.  
(see graphic on next page for more information) |

For more information, see CDC’s Zika virus website: [www.cdc.gov/zika](http://www.cdc.gov/zika)
Effectiveness of Contraceptive Methods

Contraceptive methods are categorized into three levels of effectiveness: most effective, moderately effective, and least effective.

**Most Effective**
- Implant: 0.05%*  
- LNG - 0.2% Copper T - 0.8%
- Male Sterilization (Vasectomy): 0.15%
- Female Sterilization (Abdominal, Laparoscopic, Hysteroscopic): 0.5%

**Injectable**
- Injectable: 6%

**Pill**
- Pill: 9%

**Patch**
- Patch: 9%

**Ring**
- Ring: 9%

**Diaphragm**
- Diaphragm: 12%

**Moderately Effective**
- 6-12 pregnancies per 100 women in a year

**Least Effective**
- 18 or more pregnancies per 100 women in a year

**Condoms, sponge, withdrawal, spermicides:**
- Use correctly every time you have sex.

**Fertility awareness-based methods:**
- Abstain or use condoms on fertile days. Newest methods (Standard Days Method and TwoDay Method) may be the easiest to use and consequently more effective.

**Condoms should always be used to reduce the risk of sexually transmitted infections.**

Other Methods of Contraception

**Lactational Amenorrhea Method:** LAM is a highly effective, temporary method of contraception.

**Emergency Contraception:** Emergency contraceptive pills or a copper IUD after unprotected intercourse substantially reduces risk of pregnancy.
